The Value Boards

A professional's manual for the NFL Value Board and the College Value Board.
Every page, every number, and what a bettor does with it — written for someone starting from zero.

Fifth edition, updated from the live boards on Wednesday, November 11, 2026 (NFL Week 10, college Week 11), after the full model review: record-adjusted EV, the DraftKings + FanDuel record, closing line value on the college board, a stricter rule for model changes and a backup for skipped line snapshots. Every screenshot and worked example is from that day.

What is new in the fifth edition (November 11, 2026)

- **The EV you see first is record-adjusted.** Wherever an EV comes from the model (model-edge rows on the Bet sheet and the Best bets card, Model leans, a game's price table and headline), the figure that leads counts the model's edge only at the share that has actually shown up in graded bets: about a tenth on the NFL board, and not yet distinguishable from zero; none on the college board, where it is simply the market's own number. The model's own claim sits under it as "model +x%". A row that reads −2.2% with "model +3.0%" under it is not a bet on its EV. Price-beats-Pinnacle figures need no model and are unchanged, as are the stakes, which were already sized this way. Opener and wind rows show both figures in small type, because the column that matters for them is the record of bets of that kind. (Sections 3, 7 and 8.)
- **The record at your books.** The Live record and the Best Bets record each have two new rows: **DraftKings + FanDuel (the books you bet)** and **Other books**. The board flags prices at BetMGM and Kalshi too; if you only bet DraftKings and FanDuel, the first of those rows is your record. (Section 14.)
- **Closing line value on the college board.** It was never being computed there (a mismatch in how games were identified). It is now, and the 151 bets graded before the fix were filled in. First reading: −0.2% over those 151 against a claimed +2.6%, so the college bets' claimed edge is not showing at the close. The stake rule that mutes a kind of bet losing to the close can now work on the college board. (Sections 14 and 15.)
- **A stricter rule for model changes.** From November 11 a change is kept only if it is better on every measure on both the tuning seasons and the holdout, the holdout by at least one standard error, with the rule written before the test; and anything kept is provisional until it has been rechecked on a season it has not seen. This replaces "anything more accurate, however small" (November 4), under which small gains were as likely to be noise. Everything kept since November 4 is judged on the 2026 season alone in January. (Section 17 and the dictionary.)
- **Fresher prices.** GitHub often skips the three daily line snapshots, which left the board pricing bets off lines many hours old. A scheduled backup now starts a snapshot 40 minutes after any that did not run. (Section 17.)
- **What the review found about the model itself.** Against the closing line the NFL team ratings add nothing the line lacks; what weight the model earns comes from knowing the starting quarterback and who is out. The college model has run about a point behind the line all of 2026. Five fixes were tested that day and none was kept. The model's place is unchanged: early lines and a fair price to shop against, not a reason to bet by itself.

What was new in the fourth edition (November 4, 2026)

- **The Parlays page.** A leg finder, a boost finder and a builder for NFL and college parlays of up to 10 legs, with live DraftKings and FanDuel college props, and a graded record of the tools' own suggestions. (Section 16.)
- **College model edges carry no stake.** Regraded against Pinnacle's real 2024–2025 lines, the college model's edge did not hold, so its own edges are still listed but sized at nothing. Price bets and opener bets still carry stakes. (Sections 2, 3 and 15.)
- **New staking rules.** Wind unders at half stake until they have a season graded on forecasts, and a closing-line-value guard that takes the stake off any kind of bet that keeps losing to the close. (Sections 2 and 3.)
- **A closing-line-value dashboard** on the Model record page, with the stake rule each kind of bet is under, and a tracking table for totals against the opening total. (Section 14.)
- **Fresher prices before kickoff.** The board rebuilds 35 and 20 minutes before each kickoff window and after every line-movement alert, and the Best bets card for each window is pushed to your phone and email 20 minutes before kickoff, at DraftKings and FanDuel only. (Sections 4 and 17.)
- **Rain and snow tags** on wet games (shown, not bet), and Week 18 priced at the market. (Sections 3 and 6.)
- **Model updates on November 4** under the new keep rule (anything more accurate is kept): NFL spread ratings without turnovers, NFL pass attempts and carries from pass rate over expected, six college game-model changes, college player calibrations per position, defense against each position, and automatic quarterback starters from nfelo. (Sections 10, 15 and 17.)

1. Read this first: how a professional thinks about this board

I have made my living betting football for a long time, and I want to tell you the thing nobody tells beginners: **the model is not the product.** The price is the product.

Sportsbooks post a line, say Buffalo −3.5. That line is the market's best guess at a number that makes both sides equally likely, and the books charge you a fee on every bet (the "vig") whichever side you take. If you bet at random you lose the fee, slowly, forever. To win, you need one of two things: either you know the true probability better than the market does (an **edge** from information), or you find a book charging a better **price** than the market's true number (an edge from shopping). The second is far more common, far more reliable, and it is where almost all of my money has come from.

This board was built by someone who understood that. It has a model that projects every game, and the model is respectable: over 3,416 NFL games since 2014 it misses the final margin by 10.02 points on average, against 9.91 for the closing line. Close, but not better. "About as accurate as the market" does not pay the vig, and the board does not pretend otherwise. It measures how much of the model's claimed edge has ever turned into money and sizes the bets from that. On the NFL board the answer is **almost none**: over 2,239 graded bets from 2018 to 2025 the model claimed +4.8% and returned −1.9%. So the NFL model's own opinion stays off the bet card. In college the same measurement said about half, but when the college model was regraded against Pinnacle's real 2024–2025 lines its edge did not hold up, so since November 1 the college model's own bets carry no stake either.

So where is the money?

Three places, and the board is built around them in this order:

1. **Prices that beat Pinnacle.** Pinnacle is the sharpest book in the world: it takes big bets from professionals and moves its line fast, so its price with the vig removed is the best estimate of the true chance there is. When DraftKings, FanDuel, BetMGM or Kalshi pays more than that true chance is worth, you have an edge with no model at all. These go stale within hours.
2. **The opener.** When the model disagrees with the opening line by 2 or more points (NFL spreads), the line has historically moved toward the model before kickoff, and the side has won 55.4% at the opening number (1,012 bets, +5.6% per dollar, ±3.0%; since 2019, 54.7% and +4.3% ± 3.7% on 646). **Read that sentence carefully: the edge is the line moving toward the model.** The same sides, graded at the closing line after the move, win 51.9%, below the 52.4% you need at −110. Once the market has moved, the edge is gone. That is why the board has a whole section on line movement and why your phone buzzes when a gap appears.
3. **Wind unders** (NFL). Outdoor games with 10 to 19 mph of wind have gone under the closing total 56.8% of the time since 2014 (498-379-9), and 59.2% since 2019. The total falls as the forecast firms up, so these are bet early, not late. Until there is a season of these graded on forecasts rather than recorded wind, they are staked at half size.

Everything else on the page, including the model's own leans, is information. Useful, honest information, but not a bet.

> **The one sentence to remember**
>
> Bet prices that beat the sharp line, bet the model's disagreements with the opener *before* the market moves, and when the market has already moved, either tease the line or pass. The board now tells you which of those three situations every bet is in.

What a professional does not do with this board

- **Bet the biggest EV number on the page.** EV is claimed by the model; the haircut says how much of it has ever been real. On November 11 the college board's biggest number was +11.0% on ORST +13.5, on the model alone, with no stake; record-adjusted it reads 0.0%. The stake column, not the EV column, says what the board would bet.
- **Chase an opener bet after the line moved.** If the board says **Missed**, the edge you read about in the record is not on offer any more.
- **Play leans.** The Model leans document exists so that you can see what the model thinks without confusing it with a bet.
- **Judge the board on a week.** Fifty bets is noise. Closing line value (section 14) is the short-run signal; the win-loss record takes seasons.

2. The arithmetic: odds, vig, probability, EV, Kelly, teasers

Everything on these boards is built from a handful of formulas. You do not need to compute them, but you need to know what they mean.

American odds and implied probability

−110	Risk 110 to win 100. Implied chance = 110 / (110 + 100) = 52.4%. This is the break-even for a standard spread bet.
+150	Risk 100 to win 150. Implied chance = 100 / (150 + 100) = 40.0%.
−200	Risk 200 to win 100. Implied chance = 66.7%.

The vig, and "no-vig"

A book quotes both sides of a spread at −110. Each implies 52.4%, together 104.8%. The extra 4.8% is the book's margin. Remove it and you have the **no-vig** (fair) chance: 50% each. When the board says "Pinnacle's no-vig number" it means Pinnacle's two prices with the margin taken out, which is the market's honest estimate of each side's chance.

Expected value (EV)

EV per dollar = chance of winning × profit if you win − chance of losing × stake. At −110 with a true 55% chance: 0.55 × 0.909 − 0.45 × 1 = +5.0%. The board shows EV two ways:

- **EV vs sharp** (the price tier): the price against Pinnacle's no-vig chance. No model involved. This is the most trustworthy number on the site.
- **EV vs model**: the price against the market-adjusted projection's chance. Read it together with the haircut.

Kelly staking, and the caps

Kelly is the stake that grows a bankroll fastest for a given edge: edge divided by the net odds. Full Kelly is far too aggressive when your edge estimate is uncertain, so the board uses **quarter Kelly**, and caps it three ways:

Per bet	3% of bankroll.
Per game	5%, all sides together. If a game's bets add to more, every stake in that game shrinks by the same factor.
Per week	10%, everything on the sheet that week together, scaled the same way. On November 11 the NFL Week 10 sheet came to 3.7%, under the cap; next week's early lines (Week 11) came to 8.7%, also under it. With its model edges unstaked, the college Week 11 sheet came to 5.1%.

Stakes are shown in dollars at the bankroll in the box at the top of the Games page (default $1,000) and as a percentage. Change the box to your bankroll and every stake on the site follows.

The haircut

The model's chance is not used as is. Each Tuesday (NFL) and Monday (college) the full backtest measures the share of the model's claimed edge that turned into realized profit over the last eight seasons. The stake is sized from the model's chance shrunk toward the market's by that share. NFL: 11% on November 11 (8% a week earlier and 0% the week before; the measurement is noisy, ±29%), and the model's own NFL edges stay off the card either way. College: measured at 52%, but **capped at 0** NEW since November 1, because the college model's edge against consensus lines did not hold against Pinnacle's real 2024–2025 numbers. The college sheet says so in its note. If the measurement is missing, the board sizes nothing rather than everything (it "fails closed").

Bucket stakes

Opener and wind bets do not need the model to be right; they rest on their bucket's own record. When the model sizes nothing for one of them, the board sizes a **bucket stake**: quarter Kelly on Pinnacle's chance for that side at the book's own line and price, plus the bucket's edge over a fair line (its win rate shrunk halfway to break-even, less 50%). Two details matter:

- The book is the one with the **best price against Pinnacle**, not the one the model likes best. The bucket's win rate was measured at roughly −110 at the opener; it does not transfer to a plus-money price on a worse number.
- Once the line has moved toward the side, the rate used is the bucket's **win rate at the close** (51.9% for NFL spreads 2+), which is below break-even and sizes nothing.
- **Wind unders are staked at half size** NEW until they have a season graded on forecasts. Their record was built on the wind actually measured at the game, and live bets are placed on a forecast.

The closing-line-value guard NEW

Every kind of bet (price, opener, wind, model) is watched against the closing line. Once a kind has 50 or more graded bets and its average closing line value is below zero by more than two standard errors, it carries **no stake** until it recovers. Its bets stay on the sheet, marked, and stay in the ledger, so the record keeps measuring them. The Bet sheet's note names any kind that is muted. On November 11 no NFL kind had 50 graded bets yet (price bets were at 26), and the college price tier, with 92, was at −0.1% ± 1.1% and so not muted; the Closing line value table on the Model record page shows how close each one is (section 14).

Teasers

A 6-point teaser moves the line 6 points your way on every leg, and every leg must win. A two-leg teaser at −120 breaks even when each leg wins √(120/220) = **73.9%**. The board prices each leg's chance off the market's own key-number curve (no model) and marks those that clear. **Wong legs**

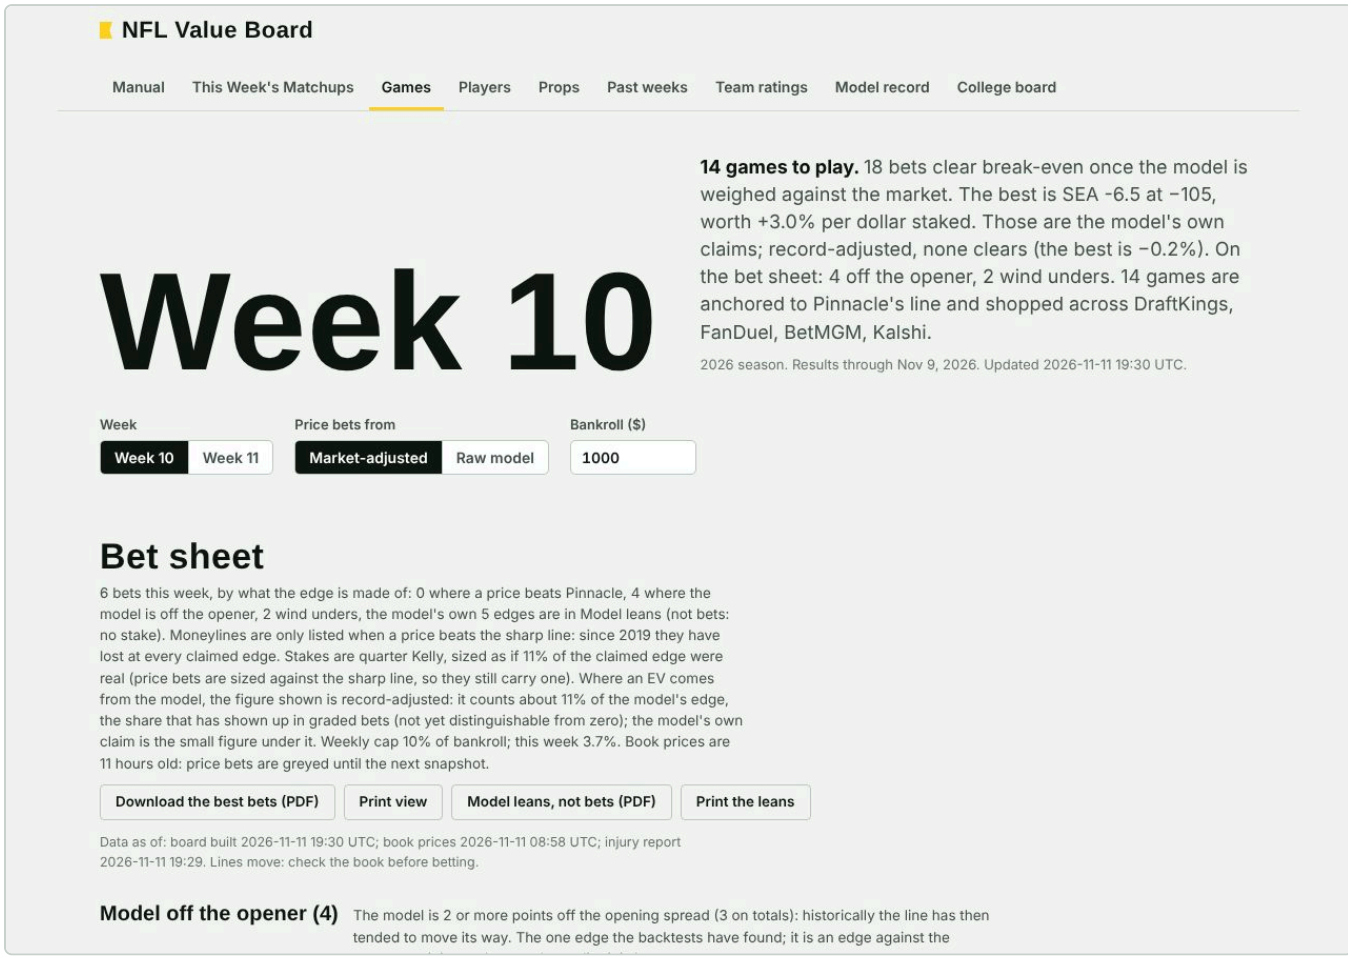

are NFL sides that a 6-point tease carries across both 3 and 7: favorites of −7.5 to −8.5 (teased to −1.5 to −2.5) and underdogs of +1.5 to +2.5 (teased to +7.5 to +8.5). They are the classic teaser legs; price them, do not bet them by rule.

Kalshi

Kalshi is an exchange. Its prices are contract prices in cents, and it charges a fee: about 7% × p × (1−p) per contract to take a price, 1.75% to rest an order. The board converts every Kalshi price to an effective American price net of the fee ("net") before any EV. Where a resting order would be worth posting, the board says **"Post on Kalshi at X¢"**: the highest price at which a maker order is still +EV. That price is now computed against the chance the stakes are sized from, which on the NFL board is Pinnacle's own number. A resting order may never fill.

3. The Games page, part one: the Bet sheet

The Games page opens with a week picker, the "Price bets from" switch (leave it on Market-adjusted), your bankroll, and then the **Bet sheet**: every bet the board would place this week, grouped by what the edge is made of.

The top of the NFL Games page on November 11. The headline says 18 bets clear break-even on the model's own claims and none once record-adjusted; the Bet sheet has 4 opener bets and 2 wind unders, the model's own five edges are in Model leans, the week uses 3.7% of the 10% cap, and book prices were 11 hours old.

The four buttons

Download the best bets (PDF)	The week's card as a PDF, rebuilt with every board update (section 7).
Print view	The same card in the browser, at your bankroll and selected week.
Model leans, not bets (PDF)	What the model thinks that is not a bet: on the NFL board the model's own edges, and every game's lean (section 7).
Print the leans	The leans document in the browser.

Below the buttons, the **Data as of** line says when the board was built and how old the book prices, injury report and designations are. Read it every time. A price is only as good as its timestamp.

The tiers, in the order to take them

Tier	What it means	Its record
Price beats Pinnacle	A retail price beats Pinnacle's no-vig number at that line by 1% or more per dollar, with no model. Take it now at the book named.	+EV against the sharp line by construction.
Model off the opener	The model is 2+ points off the opening spread (3+ on totals; college: totals only) **and the market has not taken it yet**.	NFL spreads 2+: 55.4%, +5.6% on 1,012 bets (+4.3% on 646 since 2019).
Wind unders (NFL)	An outdoor under in 10–19 mph of forecast wind, while the total has not already dropped 1.5 points. Half stake.	498-379-9 since 2014 (56.8%, +10.4% ± 3.2%); 2019 on: 238-164 (59.2%).
Model edges	Everything else the market-adjusted projection makes +EV. On the NFL board these are in Model leans. On the college board they are still listed on the sheet, but **with no stake** NEW (section 15).	Shown on every row.

Moneylines appear only in the price tier. On the graded bets since the holdout seasons began, model-picked moneylines have lost at every claimed edge.

Week 18 NEW is priced at the market: the model's spreads and moneylines that week are not used for the opener or model tiers or the line-movement alerts, because in Week 18 the model has trailed the closing line by about a point of margin, against about a tenth of a point in every other week. Price bets still count, and totals are unchanged.

Rain and snow NEW: a game forecast to get 2 mm or more of rain, or any snow, during the game window carries a "Rain N mm" or "Snow forecast" tag on its card, its page, the Matchups views and the Model leans document. It is information only; nothing is staked on it until the forecasts have been graded.

> **The opener tier is judged at today's line**
>
> An opener bet stays in the tier while the line has moved no more than half a point toward the model, or while the gap at today's line still clears the threshold. Once the market has moved to the model, the bet drops out, is marked **Missed**, and gets no bucket stake. On October 31 (when this rule went in) it took **DAL −7.5** (opened −6.5, model −9.2, now −7.5) and **CIN −13** (opened −10, model −14.1) off the NFL card. Before the rule they were being staked at 2.3% each at prices worse than Pinnacle's own.

Reading one row, column by column

Bet sheet

6 bets this week, by what the edge is made of: 0 where a price beats Pinnacle, 4 where the model is off the opener, 2 wind unders, the model's own 5 edges are in Model leans (not bets: no stake). Moneylines are only listed when a price beats the sharp line: since 2019 they have lost at every claimed edge. Stakes are quarter Kelly, sized as if 11% of the claimed edge were real (price bets are sized against the sharp line, so they still carry one). Where an EV comes from the model, the figure shown is record-adjusted: it counts about 11% of the model's edge, the share that has shown up in graded bets (not yet distinguishable from zero); the model's own claim is the small figure under it. Weekly cap 10% of bankroll; this week 3.7%. Book prices are 11 hours old: price bets are greyed until the next snapshot.

Download the best bets (PDF) | Print view | Model leans, not bets (PDF) | Print the leans

Data as of: board built 2026-11-11 19:30 UTC; book prices 2026-11-11 08:58 UTC; injury report 2026-11-11 19:29. Lines move: check the book before betting.

Model off the opener (4)

The model is 2 or more points off the opening spread (3 on totals): historically the line has then tended to move its way. The one edge the backtests have found; it is an edge against the opener, so it is worth more the earlier it is bet.

Pick	Where	EV per $1	What the model's number is made of	Line and timing	Record o
SEA -6.5 SEA @ LV, Sun 4:05 PM (in 4 days)	DraftKings −6.5 −108 (+1.6% here)	record-adjusted −2.2% model +3.0%	**Model SEA −10.4 vs SEA −6.5 (+3.9):** ratings −9.8, LV quarterback −4.2, home field +2.1	**Bet now.** Favorites and overs usually get more expensive by the weekend. Unders in 10- mph: 498-37 (56.8%, +10. 3.2%); 2019-

The NFL Bet sheet on November 11: no price bets, four opener bets and two wind unders. The EV column shows the record-adjusted figure with the model's own claim under it.

Pick	The side and line, the game, the kickoff and how far away it is.
Where	The book to bet at, its line and price (and the net price after Kalshi's fee). For a price bet, the book that beats Pinnacle; for a bucket bet, the book with the best price against Pinnacle; otherwise the best book. "Post on Kalshi at X¢" when a resting order is worth placing.
EV per $1	For a price bet, EV against Pinnacle's no-vig chance ("vs sharp"). Otherwise (from November 11) the **record-adjusted** EV, which counts the model's edge only at the share that has shown up in graded bets, with the model's own claim under it as "model +x%". On opener and wind rows both are in small type: read the Record of this kind column first.
What the model's number is made of	The model's line against the market, the gap now and at the open, and the three biggest pieces of the number. **Red** pieces are this week's news (quarterbacks, injuries, snaps, wind) rather than the season's ratings.
Line and timing	The verdict (below), where the line opened, where it is now, and Pinnacle's path since it opened.
Record of this kind	How this bucket has done in the backtest and, once graded, live.
Stake	Dollars and share of bankroll, after the bet, game and week caps. " (bucket)" means it was sized from the bucket's record, not the model. "No stake" on a college model edge, or on a kind muted by the closing-line-value guard.

The verdicts

Verdict	When
Bet now	A price bet (off-market prices are corrected within hours); an opener bet whose line is moving the model's way; a **wind under** (totals drop as the forecast firms); a favorite or over more than 36 hours out.
Missed	The market has moved to the model, or the total has already dropped for the wind. The edge at the opener is mostly gone. The teaser leg (section 4) is the way in, if it clears.
Check the price	A price bet built on book prices more than 3 hours old. The row is greyed. Take it only if the book still shows that price or better.
Can wait	An underdog or under (not a wind under) more than 24 hours out: those usually get cheaper close to kickoff.
Wait, or size down	The line has gone a point or more against the model since the open: the market disagrees.
Now or never	Under six hours to kickoff.

How I read this week's NFL card (November 11, Week 10)

No price bets. The book prices were 11 hours old when the board was built and nothing beat Pinnacle by 1%. That is normal on a Wednesday; price bets appear after a fresh snapshot and are usually gone within hours, which is why the scheduled backup for skipped snapshots matters.

SEA −6.5 (DraftKings −108), MIN +3.5 (BetMGM −112), LAC +4.5 (FanDuel −110), KC −3.5 (DraftKings −102) (opener tier, $1 to $9 bucket stakes): the model was 2 or more points off each opener. Look at the EV column: record-adjusted −1.4% to −2.6%, with the model's own +0.9% to +3.0% under it in small type. On EV alone none of these is a bet. They are on the sheet because bets of this kind have won 54.7% since 2019, which is what the Record column says, and why the stake says "(bucket)". SEA, MIN and KC say "Bet now"; LAC says "Can wait" (underdogs usually get cheaper). MIN's best price is at BetMGM: if you only bet DraftKings and FanDuel, check their price on the same number, or wait for the kickoff alert, which does that for you.

Under 51 BUF at NYJ, Under 40.5 HOU at CLE (wind, 11 mph forecast, $8 and $11 at half stake): bet now, before the totals drop. Their EV is negative on both readings; they are bet on the bucket's record, not the model's opinion.

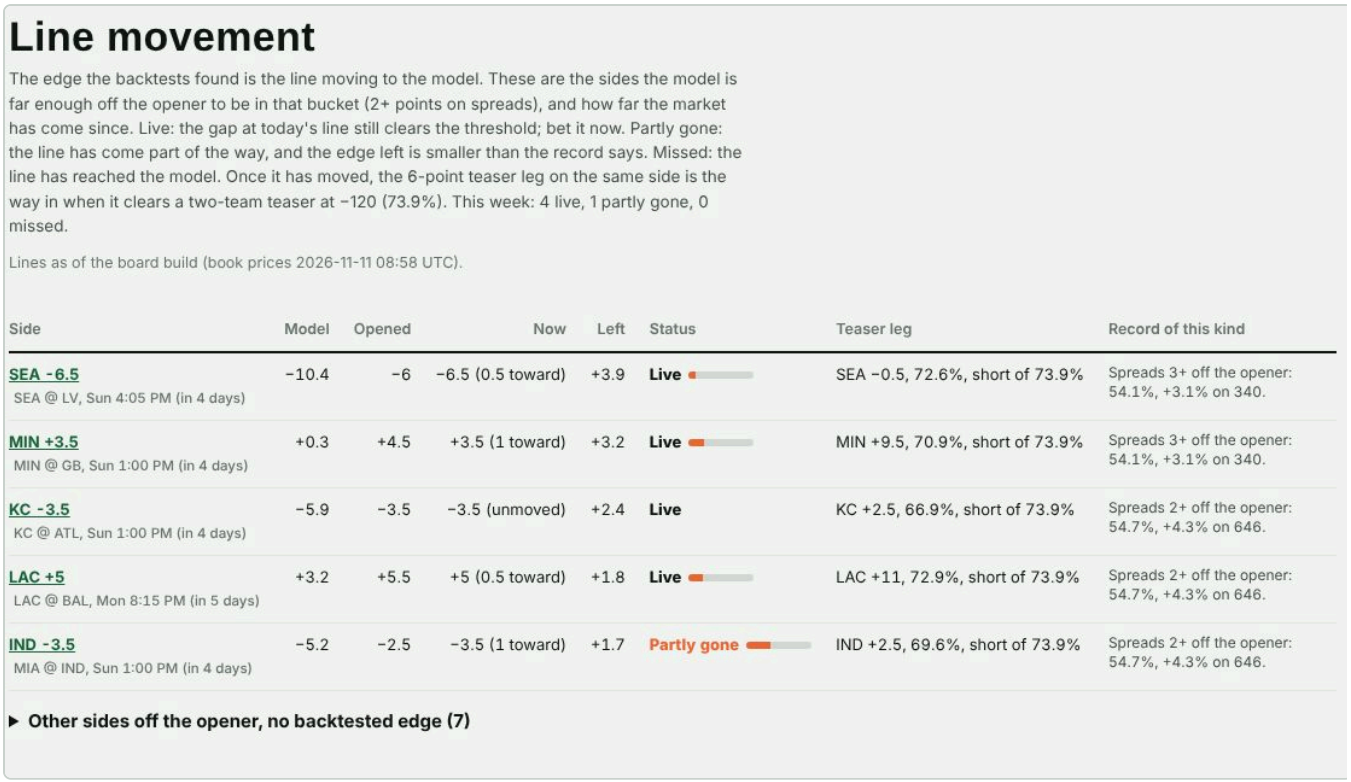

That is six bets and 3.7% of bankroll. The model's five NFL edges are in Model leans, and I don't bet them.

What is on the sheet versus what is in the ledger

Every bet that appears on the sheet is written into the ledger the first time it appears, at that price, and never changed. If the board later changes its mind (a quarterback ruled out, a line that moved to the model), the bet comes off the sheet and the ledger marks it **withdrawn**. By November 11 the NFL ledger had 119 bets: 29 kept on the sheet (to kickoff, or still on it this week) and 90 withdrawn before kickoff, most of them by the "Missed" rule. Section 14 explains why both records are kept.

4. The Games page, part two: Line movement, the phone alerts and the Best bets alert

If the edge is the line moving toward the model, you want to know two things: **where the model disagrees with the opener**, and **how far the market has already come**. That is this section.

Line movement

The edge the backtests found is the line moving to the model. These are the sides the model is far enough off the opener to be in that bucket (2+ points on spreads), and how far the market has come since. Live: the gap at today's line still clears the threshold; bet it now. Partly gone: the line has come part of the way, and the edge left is smaller than the record says. Missed: the line has reached the model. Once it has moved, the 6-point teaser leg on the same side is the way in when it clears a two-team teaser at −120 (73.9%). This week: 4 live, 1 partly gone, 0 missed.

Lines as of the board build (book prices 2026-11-11 08:58 UTC).

Side	Model	Opened	Now	Left	Status	Teaser leg	Record of this kind
SEA -6.5 SEA @ LV, Sun 4:05 PM (in 4 days)	−10.4	−6	−6.5 (0.5 toward)	+3.9	Live	SEA −0.5, 72.6%, short of 73.9%	Spreads 3+ off the opener: 54.1%, +3.1% on 340.
MIN +3.5 MIN @ GB, Sun 1:00 PM (in 4 days)	+0.3	+4.5	+3.5 (1 toward)	+3.2	Live	MIN +9.5, 70.9%, short of 73.9%	Spreads 3+ off the opener: 54.1%, +3.1% on 340.
KC -3.5 KC @ ATL, Sun 1:00 PM (in 4 days)	−5.9	−3.5	−3.5 (unmoved)	+2.4	Live	KC +2.5, 66.9%, short of 73.9%	Spreads 2+ off the opener: 54.7%, +4.3% on 646.
LAC +5 LAC @ BAL, Mon 8:15 PM (in 5 days)	+3.2	+5.5	+5 (0.5 toward)	+1.8	Live	LAC +11, 72.9%, short of 73.9%	Spreads 2+ off the opener: 54.7%, +4.3% on 646.
IND -3.5 MIA @ IND, Sun 1:00 PM (in 4 days)	−5.2	−2.5	−3.5 (1 toward)	+1.7	Partly gone	IND +2.5, 69.6%, short of 73.9%	Spreads 2+ off the opener: 54.7%, +4.3% on 646.

▸ **Other sides off the opener, no backtested edge (7)**

NFL Week 10 Line movement on November 11: four sides live and one partly gone.

The columns

Side	The model's side at today's line, the game and kickoff.
Model / Opened / Now	All from that side's point of view: PIT −3.5 with model −7 means the model makes Pittsburgh a 7-point favorite. "Now" says how far the line has moved and which way.
Left	The gap still between the model and today's line, in points.
Status	**Live**: the gap at today's line still clears the threshold, or the line has moved no more than half a point. Bet it now. **Partly gone**: the line has come part of the way; the bar shows how much of the gap is closed. **Missed**: the line has reached or passed the model.
Teaser leg	The same side teased 6 points at today's line, its chance from the market's curve, whether it clears 73.9%, and a Wong tag.
Record of this kind	The opener report's row for a gap this size, on the holdout seasons.

Which sides are listed

Only sides in a bucket that has made money against the opener on the holdout seasons:

Board	Market	Threshold	Record at the opener
NFL	Spreads	2+ points	54.7%, +4.4% on 621 bets since 2019; 3+: 53.5%, +2.1% on 322
College	Totals	3+ points	55.3%, +5.6% on 1,288 bets since 2021 (5+: 55.0%, +5.0% on 412)
College	Spreads	5+ points	54.3%, +3.5% on 735 bets (below 5 points: negative)

Everything else that is off the opener, such as NFL totals (tracked on the Model record page, not yet a bet; section 14) and college spreads under 5 points, is folded under **"Other sides off the opener, no backtested edge"**. Read it for what the market is doing, not as bets.

How fresh it is

The board's build writes the section, and then **every line snapshot re-measures it at Pinnacle's newest line**, without a rebuild. The stamp under the heading says which line it used. Snapshots run three times a day, hourly from Sunday evening to Tuesday night (when new lines open), hourly on game days, and 35 and 20 minutes before each kickoff (section 17). **Any snapshot that sends an alert also rebuilds that league's board** NEW, any day of the week, so the Bet sheet is never older than the push you just got.

The phone alerts

After every snapshot, any listed side that is **new**, or whose status **changes** (Live → Partly gone → Missed), is pushed to your phone through the **ntfy** app and posted to the "opener-alerts" issue on GitHub, which mentions you so the GitHub app notifies you too. A push reads like this:

```
NFL DAL -7.5 (ARI @ DAL): model -9.2, opened -6.5, now -7.5 (moved 1 toward); 1.8
left. Partly gone. 6-pt tease to -1.5 (72%, Wong)
```

Setup (done once): install ntfy, subscribe to a private topic name, and save that name (just the name, not the ntfy.sh address) as the repository secret `NTFY_TOPIC`. The first push after setup lists every current gap; after that you only hear about changes.

> **What to do with a push**
>
> **New, Live:** this is the moment the edge exists. Find the best price on the side (the sheet's Where column, or your books) and bet it.
>
> **Live → Partly gone:** the market is moving your way. If you already have it, good: that is closing line value. If you don't, the straight bet is worth much less than its record says. Look at the teaser leg.
>
> **→ Missed:** the line has reached the model. No straight bet. If the teaser leg clears 73.9% (often a Wong leg), it can go into a two-team teaser with another leg that clears.

College volume can be high: on November 11 the college board had 19 live sides, 11 partly gone and 9 missed in its buckets, against 4 live and 1 partly gone on the NFL board. Treat a very large college gap (the model at 58.3 on an Auburn–Mississippi State total that opened 51.5 and is now 50) as a reason to look, not a reason to bet.

The Best bets alert NEW

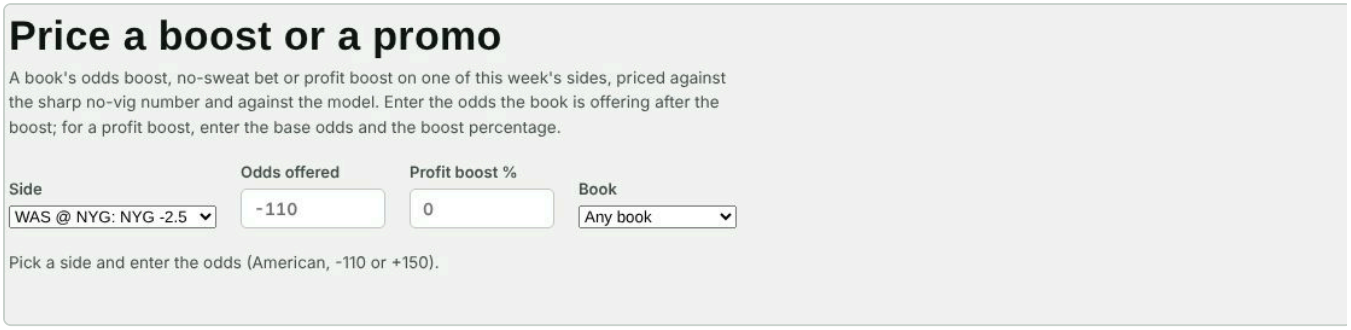

Twenty minutes before each kickoff window, after the last pre-kickoff rebuild, the board sends that window's Best bets card to your phone (the same ntfy topic) and as a comment on the "best-bets" issue on GitHub, which emails you. Tapping the push opens the Best bets page on that league's board. It lists the card exactly as the Best Bets record will grade it, but **at DraftKings and FanDuel only**: each bet is shown at the better of the two that still qualifies under its own rule (a price bet must still beat Pinnacle's no-vig number; anything else must still be +EV). When neither book qualifies, the bet is listed as **NOT A BET** with the best price at the two books and the book the card used. A window with nothing on the card sends nothing.

```
Best bets: NFL Sun 1:00 PM ET (3 bets, 1 not at DK/FD)
NYG@PHI: PHI +3.5 -115 · DraftKings · stake 0.7% · EV +2.5%
NYG@PHI: Under 40.5 · NOT A BET at DraftKings or FanDuel (not +EV; best there:
DraftKings Under 39.5 -105, EV -2.4%; card has it at BetMGM)
```

This is the last word before kickoff. If you only bet DraftKings and FanDuel, it is the card to bet.

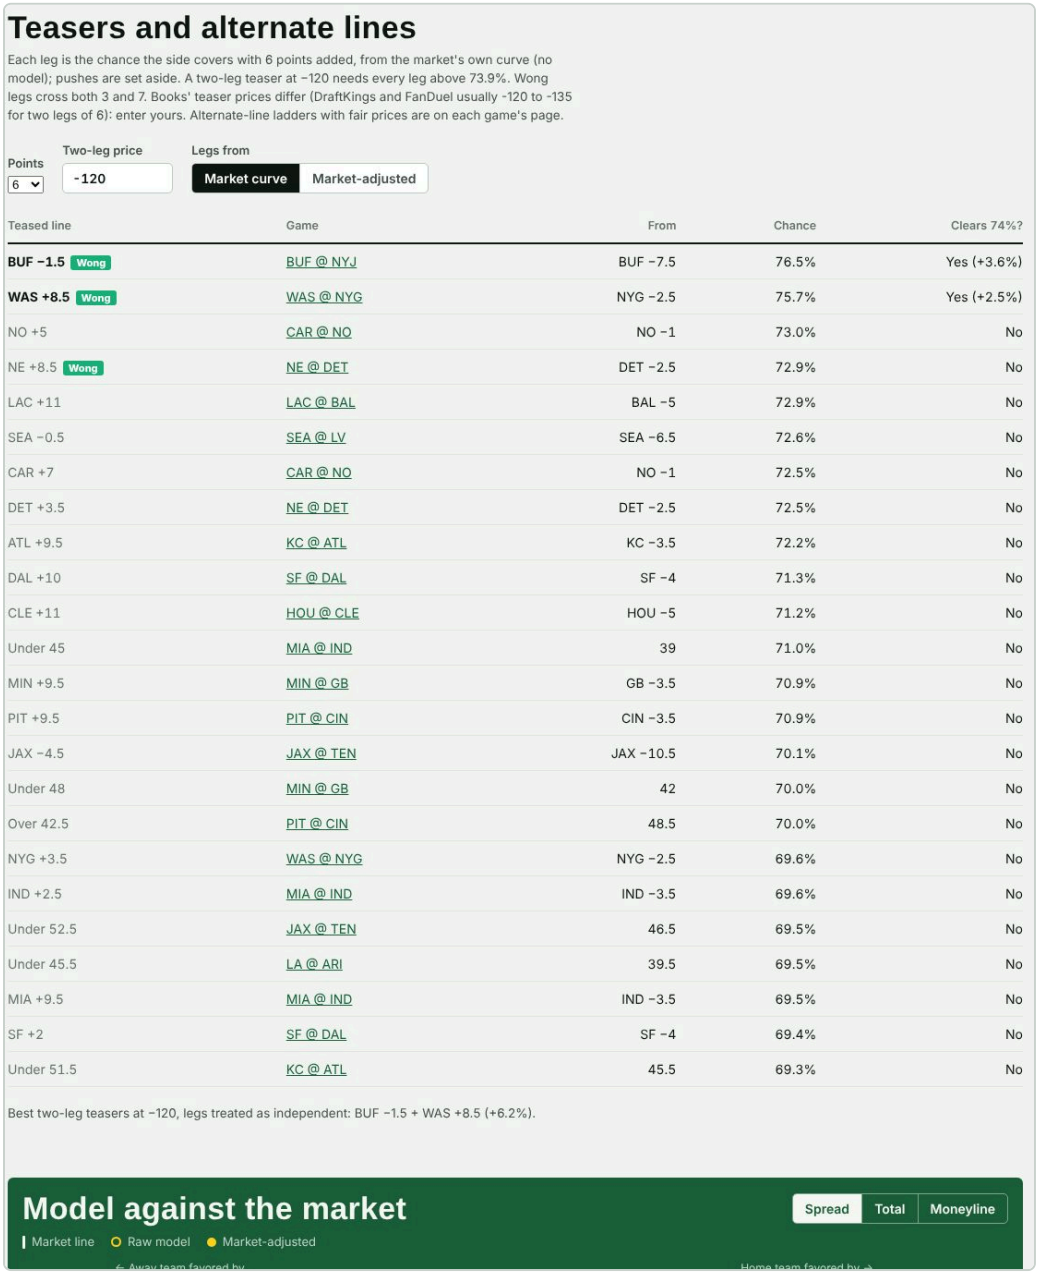

5. The Games page, part three: the boost calculator, teasers and alternate lines

Price a boost or a promo

Pick a side, enter the boosted odds the book is offering (or the base odds and a profit-boost percentage), choose a book, and the calculator prices it against Pinnacle's no-vig chance and against the model. A boost that is +EV against the sharp number is the best bet a recreational bettor ever gets. Boosts are capped by the book, so size to the cap, not to the Kelly number.

Teasers and alternate lines

The teaser table on November 11: BUF −1.5 (76.5%) and WAS +8.5 (75.7%) are Wong legs that clear 73.9%; NE +8.5 is a Wong leg that does not (72.9%).

Choose 6 or 7 points and your book's two-leg price, and every leg is listed with its chance and whether it clears. "Market curve" prices legs with no model, which is the honest default. The table below lists the best two-leg pairs, treating the legs as independent. Two legs from the same game are not independent, and the board never pairs them. Each game's own page has a full alternate-line ladder with fair prices.

How this ties to Line movement: when an opener bet goes **Missed**, the straight bet is gone, but the side often becomes a good teaser leg, because the line has moved onto or across a key number. That is the "lower odds, tease the line" play.

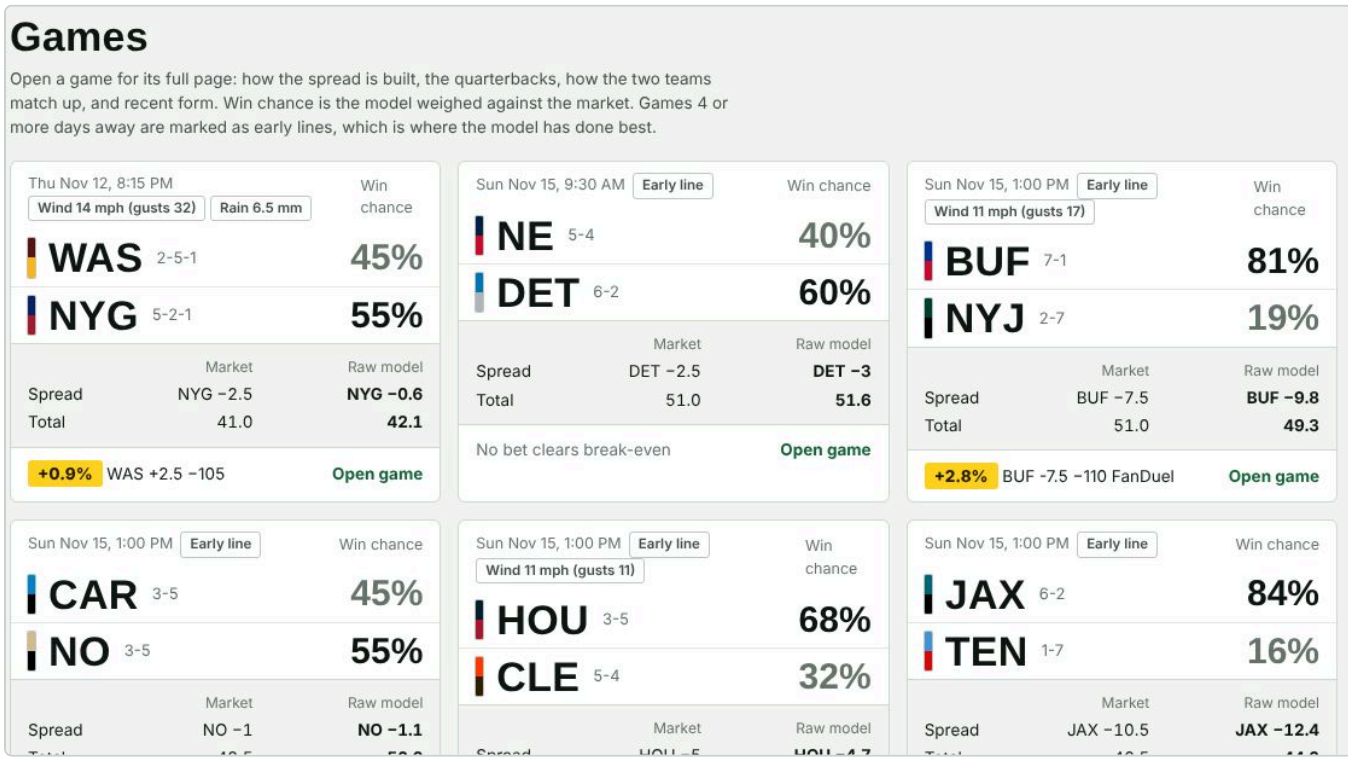

6. The Games page, part four: the chart, the cards, and Best prices

Model against the market

One row per game: the white tick is the market line, the hollow dot the raw model, the yellow dot the market-adjusted projection (28% of the way to the model on NFL spreads, 5% on totals, 17% for early lines). Switch between Spread, Total and Moneyline. The number at the right is the best EV on that market. It is the model's claim, so read it with the haircut.

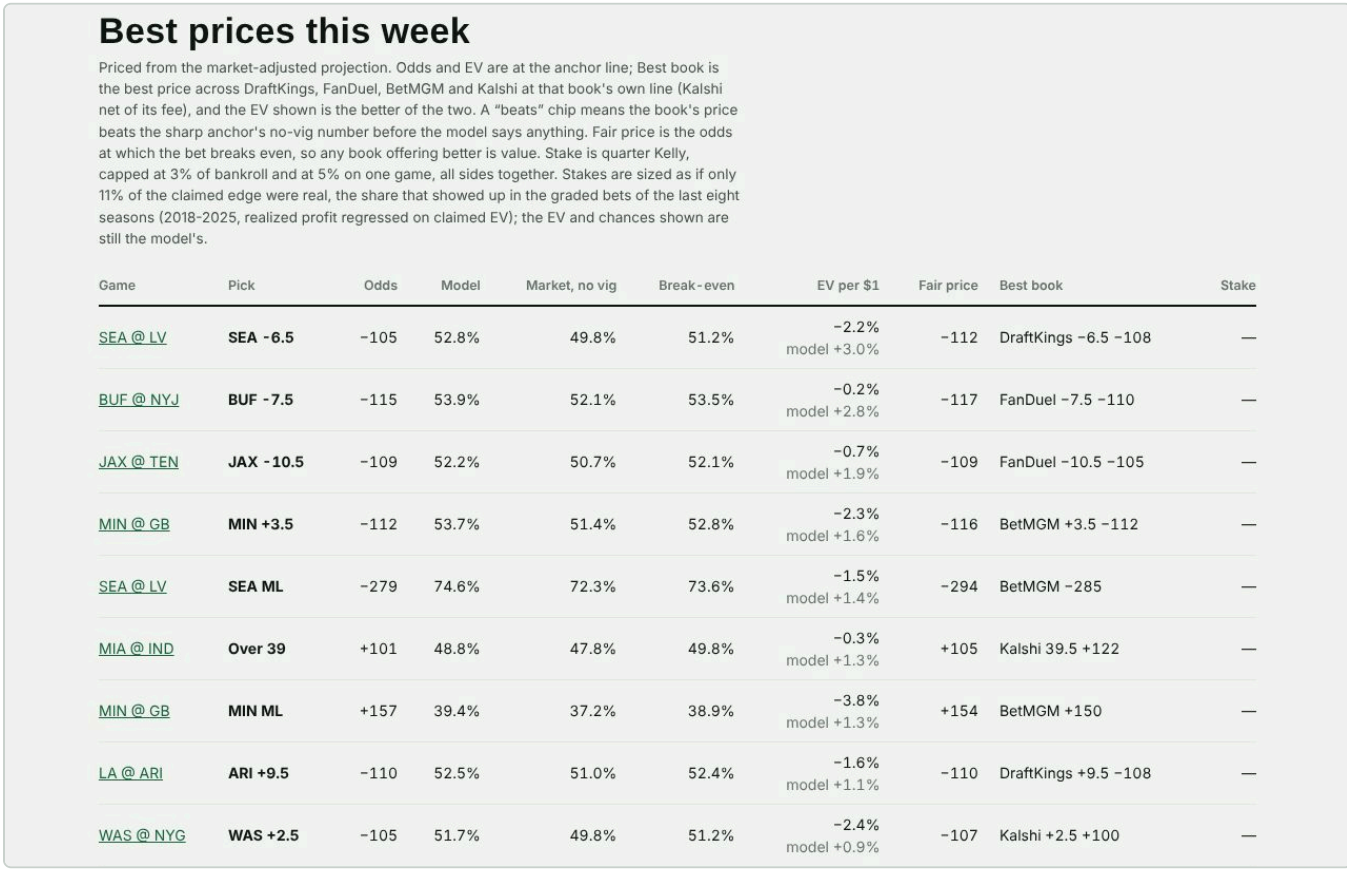

The game cards

Game cards on November 11: WAS at NYG carries a wind tag (14 mph, gusts 32) and "Rain 6.5 mm"; BUF at NYJ a wind tag; "Early line" marks lines four or more days out.

Each card has the win chance (model weighed against the market), the market and raw-model spread and total, wind and rain or snow when they matter, and the single best bet with its book. "No bet clears break-even" is a perfectly good answer. Open a game for everything else.

Best prices this week

Best prices this week

Priced from the market-adjusted projection. Odds and EV are at the anchor line; Best book is the best price across DraftKings, FanDuel, BetMGM and Kalshi at that book's own line (Kalshi net of its fee), and the EV shown is the better of the two. A “beats” chip means the book's price beats the sharp anchor's no-vig number before the model says anything. Fair price is the odds at which the bet breaks even, so any book offering better is value. Stake is quarter Kelly, capped at 3% of bankroll and at 5% on one game, all sides together. Stakes are sized as if only 11% of the claimed edge were real, the share that showed up in the graded bets of the last eight seasons (2018-2025, realized profit regressed on claimed EV); the EV and chances shown are still the model's.

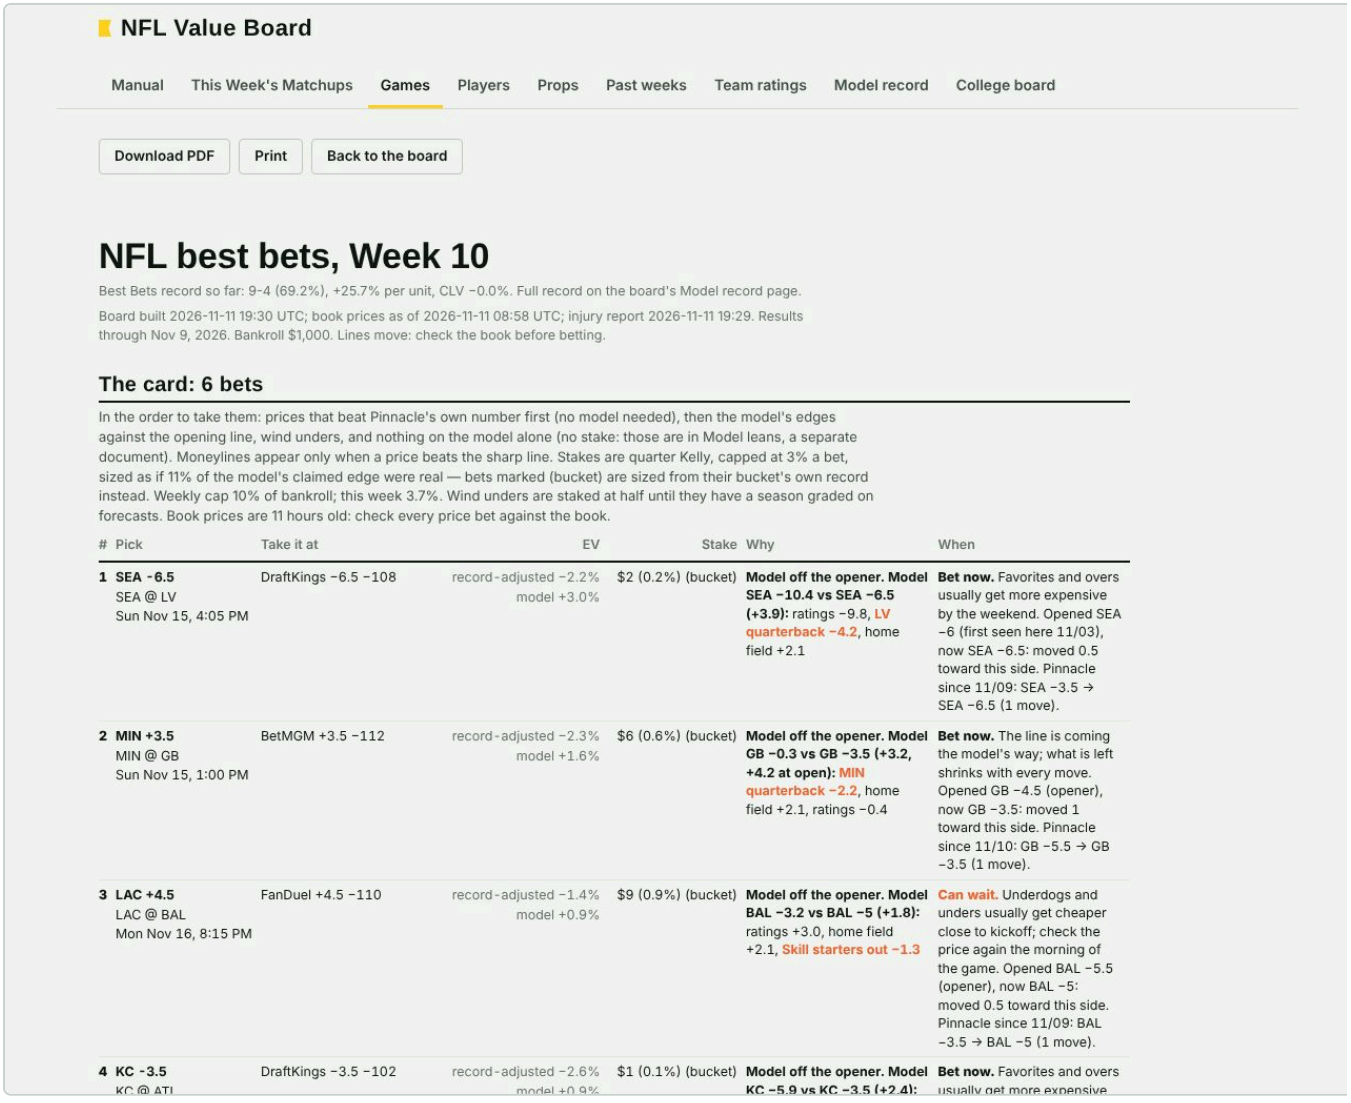

Game	Pick	Odds	Model	Market, no vig	Break-even	EV per $1	Fair price	Best book	Stake
SEA @ LV	**SEA -6.5**	−105	52.8%	49.8%	51.2%	−2.2% model +3.0%	−112	DraftKings −6.5 −108	—
BUF @ NYJ	**BUF -7.5**	−115	53.9%	52.1%	53.5%	−0.2% model +2.8%	−117	FanDuel −7.5 −110	—
JAX @ TEN	**JAX -10.5**	−109	52.2%	50.7%	52.1%	−0.7% model +1.9%	−109	FanDuel −10.5 −105	—
MIN @ GB	**MIN +3.5**	−112	53.7%	51.4%	52.8%	−2.3% model +1.6%	−116	BetMGM +3.5 −112	—
SEA @ LV	**SEA ML**	−279	74.6%	72.3%	73.6%	−1.5% model +1.4%	−294	BetMGM −285	—
MIA @ IND	**Over 39**	+101	48.8%	47.8%	49.8%	−0.3% model +1.3%	+105	Kalshi 39.5 +122	—
MIN @ GB	**MIN ML**	+157	39.4%	37.2%	38.9%	−3.8% model +1.3%	+154	BetMGM +150	—
LA @ ARI	**ARI +9.5**	−110	52.5%	51.0%	52.4%	−1.6% model +1.1%	−110	DraftKings +9.5 −108	—
WAS @ NYG	**WAS +2.5**	−105	51.7%	49.8%	51.2%	−2.4% model +0.9%	−107	Kalshi +2.5 +100	—

Every side the market-adjusted projection rates +EV, best first: model chance, Pinnacle's no-vig chance, break-even, EV, fair price, best book, and stake. A "beats" chip marks a price that beats Pinnacle on its own. On both boards most rows show no stake, because the model's own edges are not staked. This table is the model's view; the Bet sheet is the board's. The Games headline counts only the Bet sheet's bets, not this table's.

7. The two documents: Best bets and Model leans

The board builds two documents every time it updates, both linked from the Bet sheet and from the landing page.

Best bets (best-bets.pdf): what to bet

NFL Value Board

Manual | This Week's Matchups | Games | Players | Props | Past weeks | Team ratings | Model record | College board

Download PDF | Print | Back to the board

NFL best bets, Week 10

Best Bets record so far: 9-4 (69.2%), +25.7% per unit, CLV −0.0%. Full record on the board's Model record page.

Board built 2026-11-11 19:30 UTC; book prices as of 2026-11-11 08:58 UTC; injury report 2026-11-11 19:29. Results through Nov 9, 2026. Bankroll $1,000. Lines move: check the book before betting.

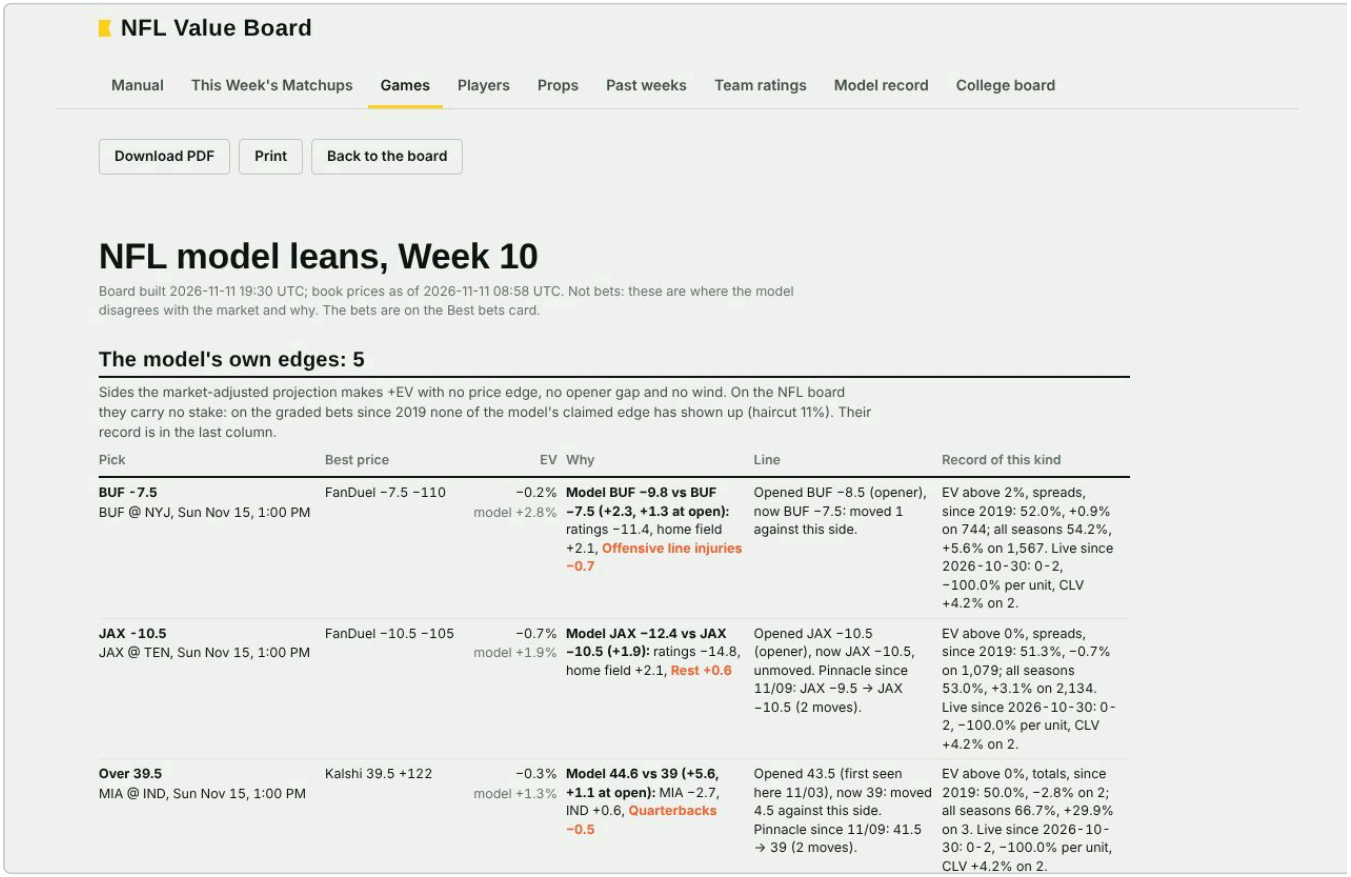

The card: 6 bets

In the order to take them: prices that beat Pinnacle's own number first (no model needed), then the model's edges against the opening line, wind unders, and nothing on the model alone (no stake: those are in Model leans, a separate document). Moneylines appear only when a price beats the sharp line. Stakes are quarter Kelly, capped at 3% a bet, sized as if 11% of the model's claimed edge were real — bets marked (bucket) are sized from their bucket's own record instead. Weekly cap 10% of bankroll; this week 3.7%. Wind unders are staked at half until they have a season graded on forecasts. Book prices are 11 hours old: check every price bet against the book.

#	Pick	Take it at	EV	Stake	Why	When
1	**SEA -6.5** SEA @ LV Sun Nov 15, 4:05 PM	DraftKings −6.5 −108	record-adjusted −2.2% model +3.0%	$2 (0.2%) (bucket)	**Model off the opener. Model SEA −10.4 vs SEA −6.5 (+3.9):** ratings −9.8, LV quarterback −4.2, home field +2.1	**Bet now.** Favorites and overs usually get more expensive by the weekend. Opened SEA −6 (first seen here 11/03), now SEA −6.5: moved 0.5 toward this side. Pinnacle since 11/09: SEA −3.5 → SEA −6.5 (1 move).
2	**MIN +3.5** MIN @ GB Sun Nov 15, 1:00 PM	BetMGM +3.5 −112	record-adjusted −2.3% model +1.6%	$6 (0.6%) (bucket)	**Model off the opener. Model GB −0.3 vs GB −3.5 (+3.2, +4.2 at open):** MIN quarterback −2.2, home field +2.1, ratings −0.4	**Bet now.** The line is coming the model's way; what is left shrinks with every move. Opened GB −4.5 (opener), now GB −3.5: moved 1 toward this side. Pinnacle since 11/10: GB −5.5 → GB −3.5 (1 move).
3	**LAC +4.5** LAC @ BAL Mon Nov 16, 8:15 PM	FanDuel +4.5 −110	record-adjusted −1.4% model +0.9%	$9 (0.9%) (bucket)	**Model off the opener. Model BAL −3.2 vs BAL −5 (+1.8):** ratings +3.0, home field +2.1, Skill starters out −1.3	**Can wait.** Underdogs and unders usually get cheaper close to kickoff; check the price again the morning of the game. Opened BAL −5.5 (opener), now BAL −5: moved 0.5 toward this side. Pinnacle since 11/09: BAL −3.5 → BAL −5 (1 move).
4	**KC -3.5** KC @ ATL	DraftKings −3.5 −102	record-adjusted −2.6% model +0.9%	$1 (0.1%) (bucket)	**Model off the opener. Model KC −5.9 vs KC −3.5 (+2.4):**	**Bet now.** Favorites and overs usually get more expensive

The week's card in the order to take it: every bet on the sheet with the book, price, EV, stake, why and when, then the teaser legs that clear −120 with the best pairs, the week's prop flags (NFL), and the records each kind of bet carries. The header shows when the board was built, how old the prices are, the weekly cap, and once games are graded, the **Best Bets record** to date. On the NFL board the card no longer includes the model's own edges or every game's lean: **the card holds only bets.**

Model leans (model-leans.pdf): what the model thinks

NFL Value Board

Manual | This Week's Matchups | Games | Players | Props | Past weeks | Team ratings | Model record | College board

Download PDF | Print | Back to the board

NFL model leans, Week 10

Board built 2026-11-11 19:30 UTC; book prices as of 2026-11-11 08:58 UTC. Not bets: these are where the model disagrees with the market and why. The bets are on the Best bets card.

The model's own edges: 5

Sides the market-adjusted projection makes +EV with no price edge, no opener gap and no wind. On the NFL board they carry no stake: on the graded bets since 2019 none of the model's claimed edge has shown up (haircut 11%). Their record is in the last column.

Pick	Best price	EV	Why	Line	Record of this kind
BUF -7.5 BUF @ NYJ, Sun Nov 15, 1:00 PM	FanDuel −7.5 −110	−0.2% model +2.8%	**Model BUF −9.8 vs BUF −7.5 (+2.3, +1.3 at open):** ratings −11.4, home field +2.1, Offensive line injuries −0.7	Opened BUF −8.5 (opener), now BUF −7.5: moved 1 against this side.	EV above 2%, spreads, since 2019: 52.0%, +0.9% on 744; all seasons 54.2%, +5.6% on 1,567. Live since 2026-10-30: 0-2, −100.0% per unit, CLV +4.2% on 2.
JAX -10.5 JAX @ TEN, Sun Nov 15, 1:00 PM	FanDuel −10.5 −105	−0.7% model +1.9%	**Model JAX −12.4 vs JAX −10.5 (+1.9):** ratings −14.8, home field +2.1, Rest +0.6	Opened JAX −10.5 (opener), now JAX −10.5, unmoved. Pinnacle since 11/09: JAX −9.5 → JAX −10.5 (2 moves).	EV above 0%, spreads, since 2019: 51.3%, −0.7% on 1,079; all seasons 53.0%, +3.1% on 2,134. Live since 2026-10-30: 0-2, −100.0% per unit, CLV +4.2% on 2.
Over 39.5 MIA @ IND, Sun Nov 15, 1:00 PM	Kalshi 39.5 +122	−0.3% model +1.3%	**Model 44.6 vs 39 (+5.6, +1.1 at open):** MIA −2.7, IND +0.6, Quarterbacks −0.5	Opened 43.5 (first seen here 11/03), now 39: moved 4.5 against this side. Pinnacle since 11/09: 41.5 → 39 (2 moves).	EV above 0%, totals, since 2019: 50.0%, −2.8% on 2; all seasons 66.7%, +29.9% on 3. Live since 2026-10-30: 0-2, −100.0% per unit, CLV +4.2% on 2.

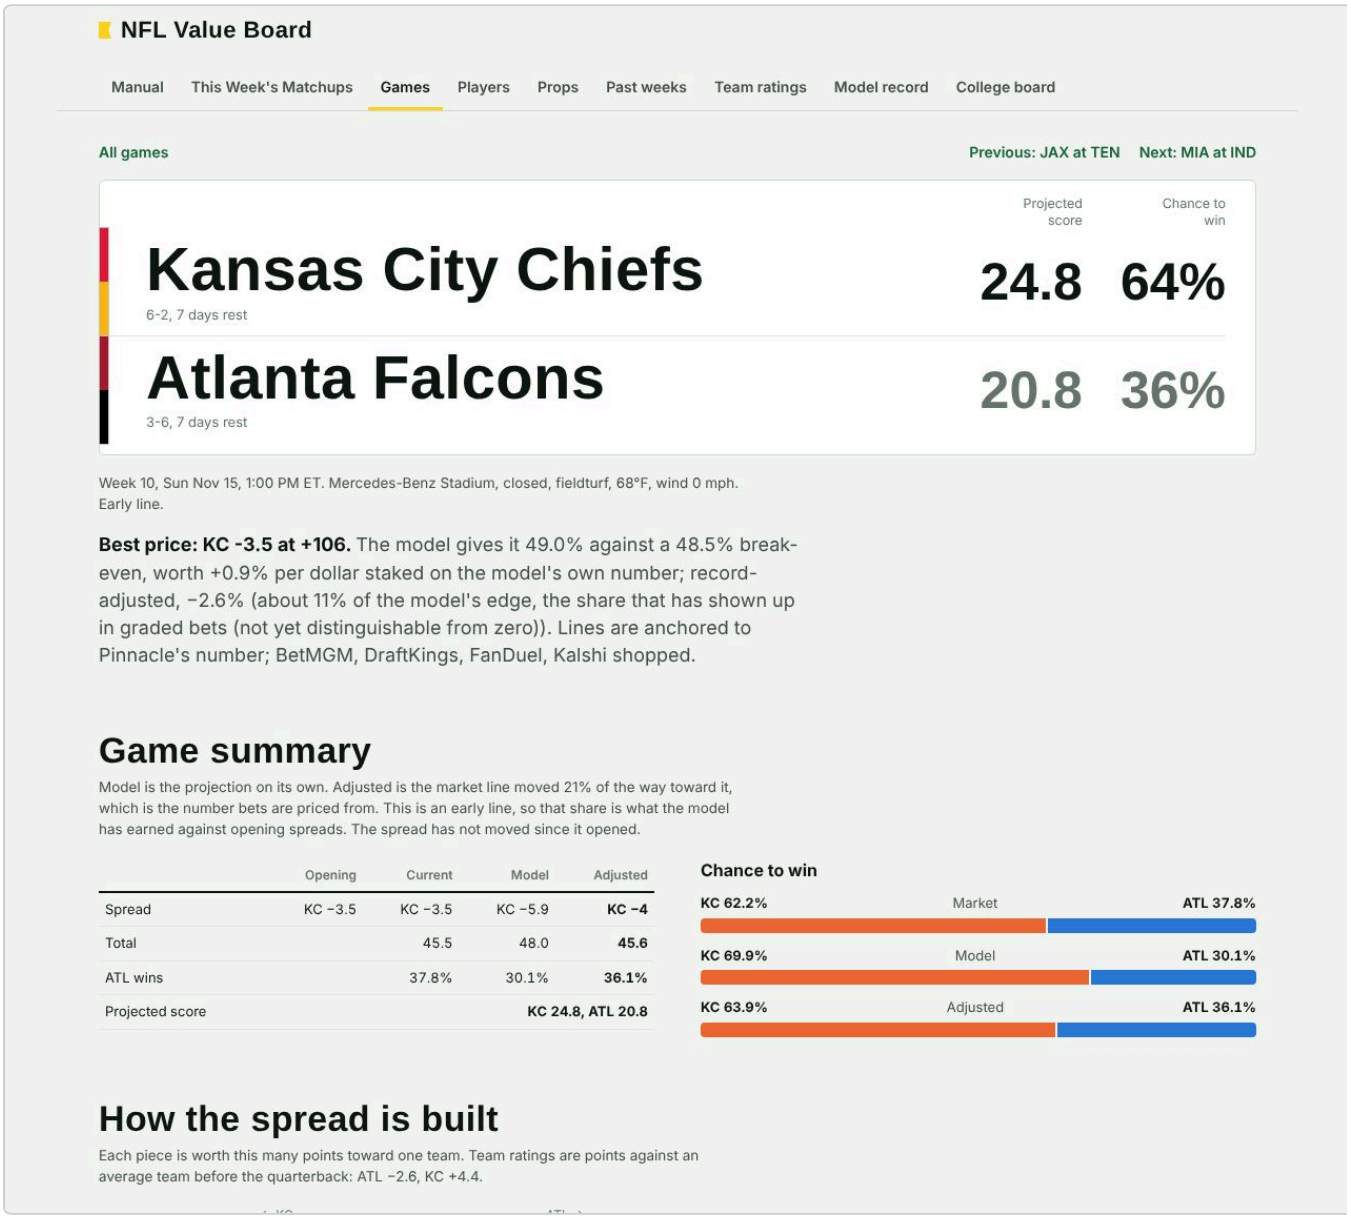

Two parts. On the NFL board, **the model's own edges**: sides the projection rates +EV with no price edge, no opener gap and no wind. On the graded bets since 2019 almost none of their claimed edge has shown up, so they carry no stake (model-only NFL spreads at EV above 0: 51.3%, −0.7% on 1,079 bets). They're kept here with their reasons and record. "Missed" marks one the market already moved to. On both boards, **every game: where the model leans**, with market, raw model and adjusted numbers, the board's side of each spread and total with its chance, the win chance, and notes (early line, wind, rain or snow, no sharp quote).

> **Why two documents**
>
> A page of leans next to the bets turns a three-bet week into a fifteen-game slate. Leans are close to 50% by design. Keep the Best bets PDF for betting and the leans for understanding the games.

The PDFs show the board's first listed week at a $1,000 bankroll. The Print buttons print whichever week and bankroll you have selected.

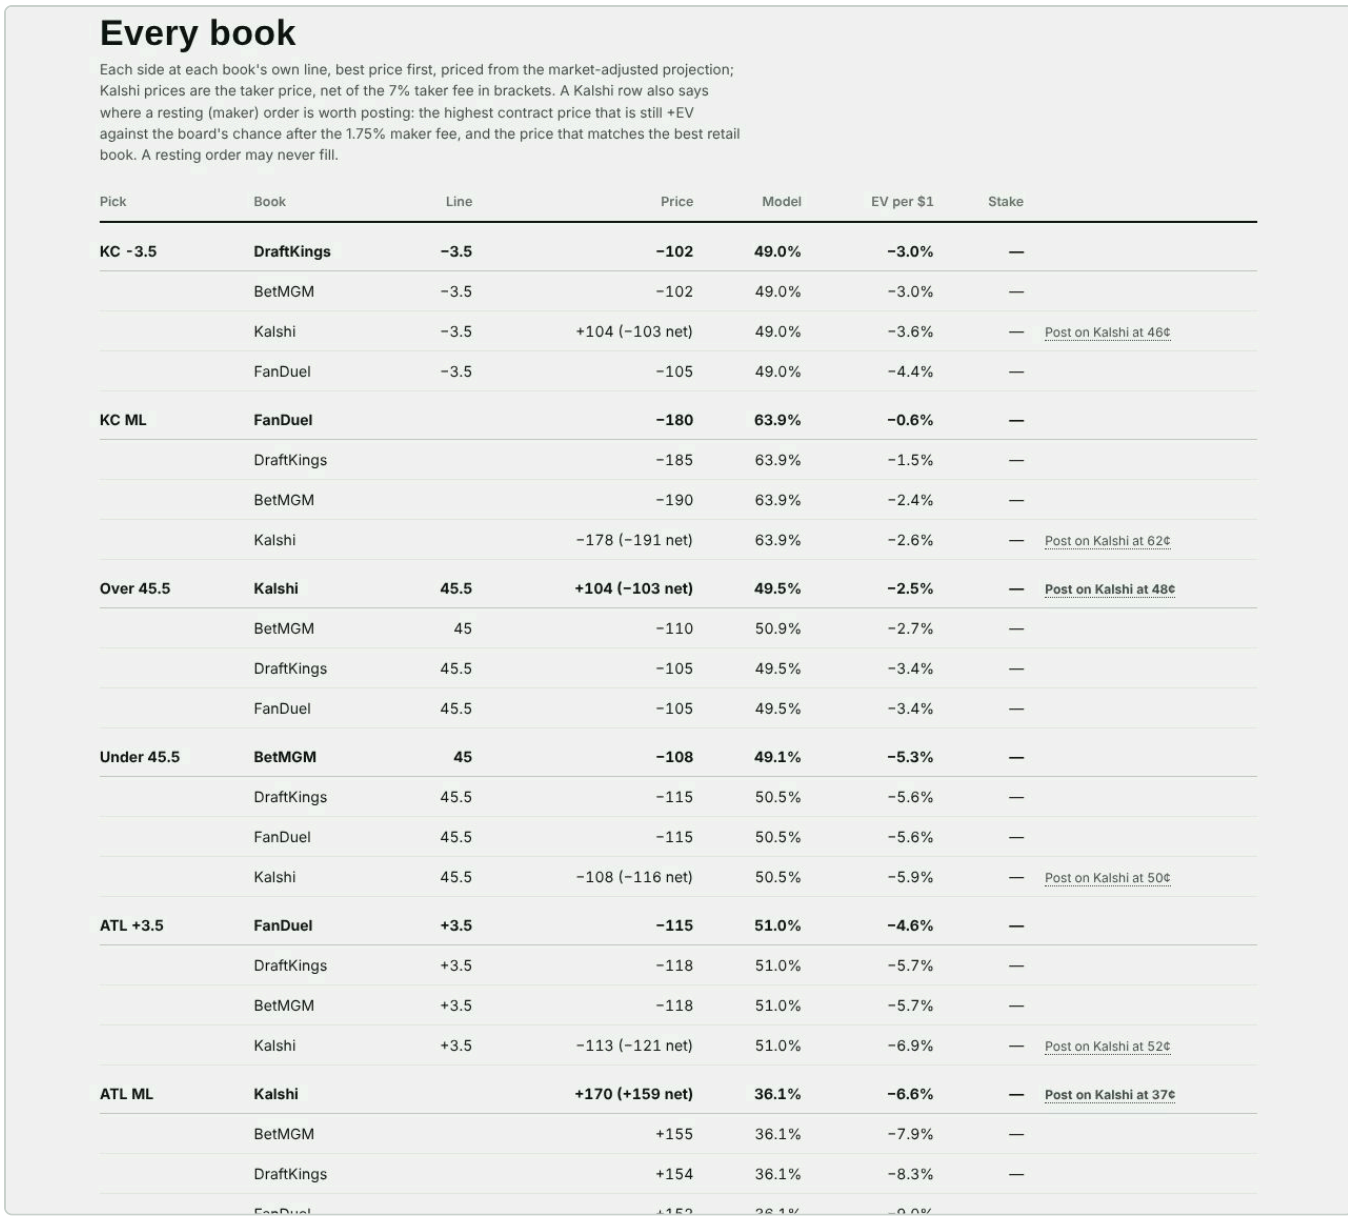

8. A game's own page

Click any game (a card, a chart row, a pick) to open its page. Using Kansas City at Atlanta, Week 10:

The top of the page: projected scores and win chances, the venue, weather and rest, the best price, and the Game summary.

Header	Records, rest days, the projected score (24.8–20.8) and the win chance (KC 64%), with links to the previous and next game.
Best price	The single best bet and why, in one sentence. Here, KC −3.5 at +106: worth +0.9% on the model's own number and −2.6% record-adjusted, and the sentence says both.
Game summary	Opening, current, model and adjusted lines side by side, and the win chance three ways (market, model, adjusted) as bars.
How the spread is built	Every piece of the model's number in points: team ratings, home field, rest, each quarterback, offensive line injuries, skill starters out, snap shares. They add up to the model spread, and the same is shown for the total. This is where you check whether a disagreement is real ("KC quarterback −0.5", "Snap shares falling −0.4": this week's news, shown in red) or stale.
Quarterbacks	Each starter's EPA per dropback over the last eight games, against league average.
How they match up	Each offense against the other defense, with league ranks colored (1–6 best).
Recent form	Each team's last ten games: margin, result against the spread and the total.

Every book

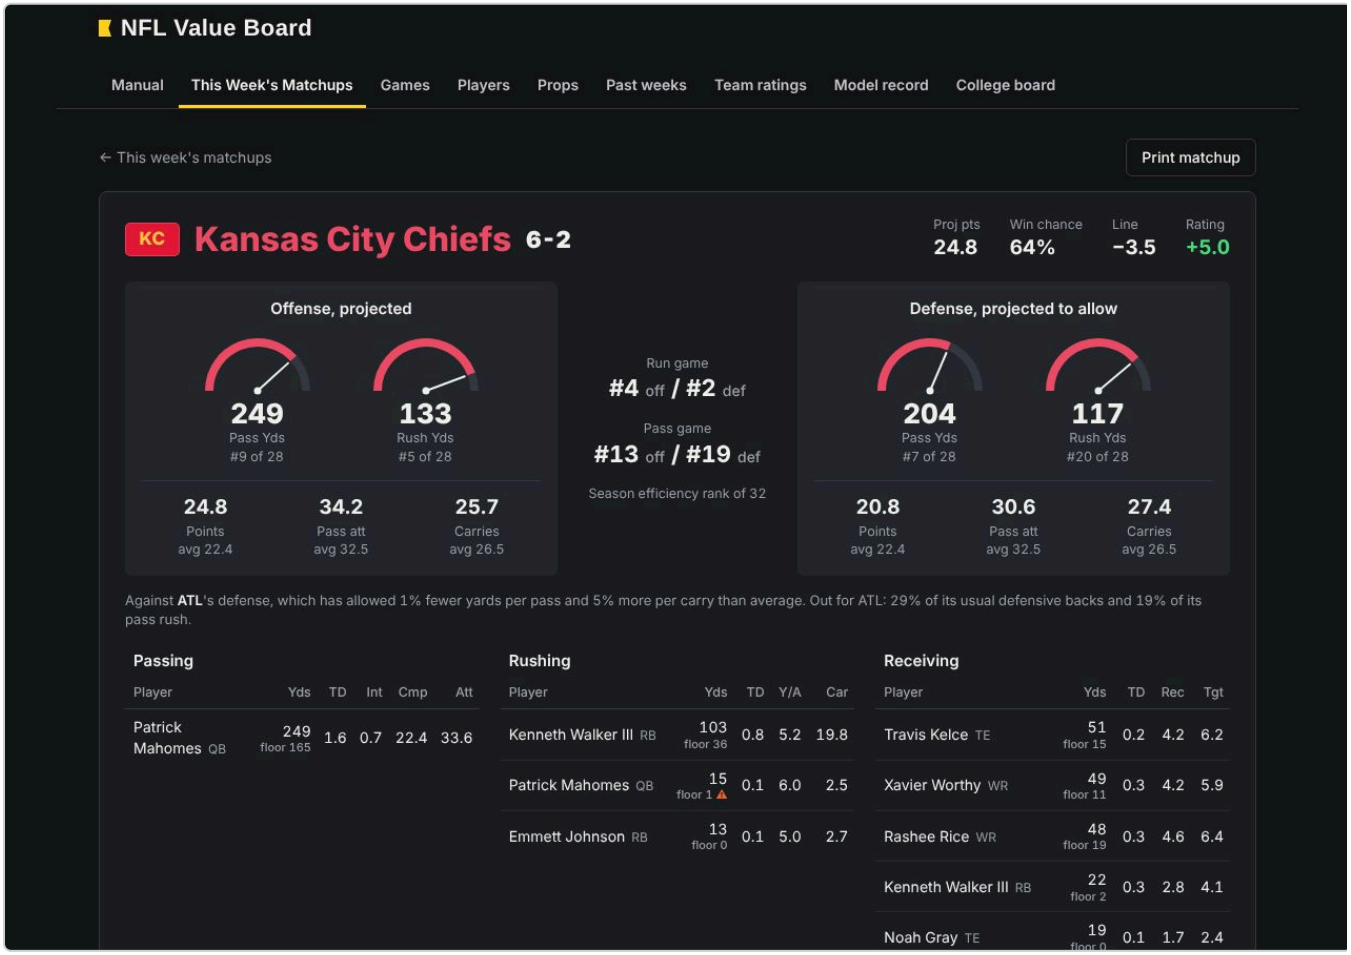

Each side at each book's own line, best price first, priced from the market-adjusted projection; Kalshi prices are the taker price, net of the 7% taker fee in brackets. A Kalshi row also says where a resting (maker) order is worth posting: the highest contract price that is still +EV against the board's chance after the 1.75% maker fee, and the price that matches the best retail book. A resting order may never fill.

Pick	Book	Line	Price	Model	EV per $1	Stake

	FanDuel		+152	36.1%	−9.0%		

Further down: Every book, each side at each book's own line, best first, with Kalshi's resting-order prices.

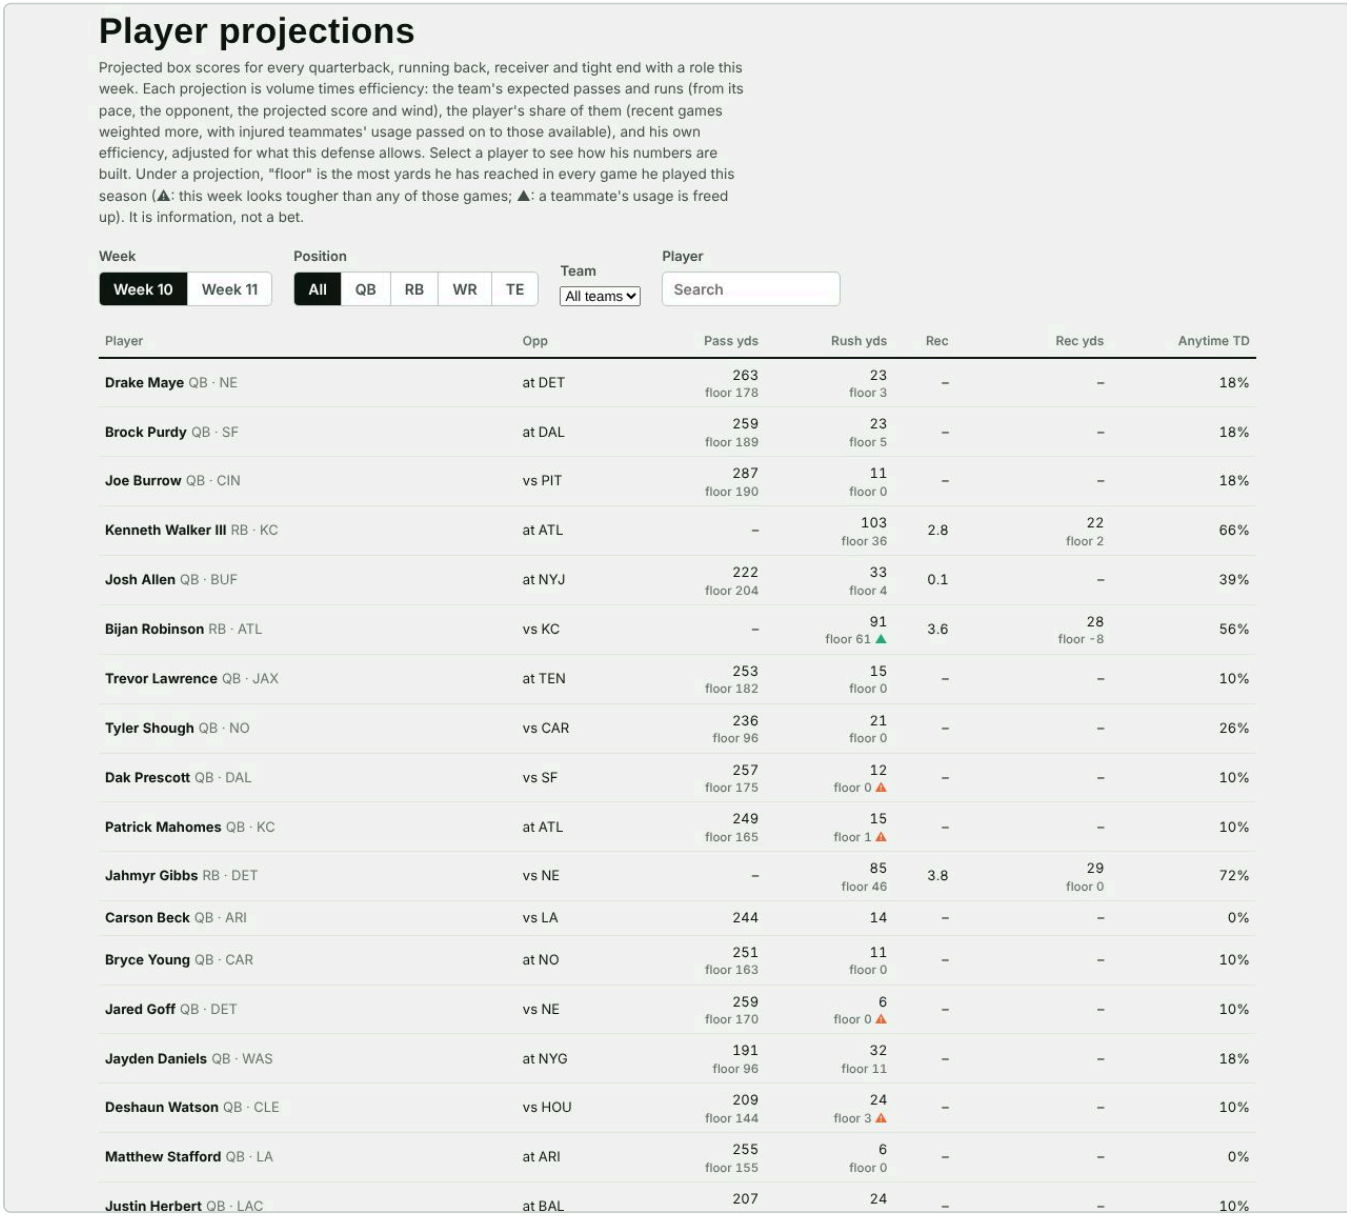

Every price	Each side at the anchor with model chance, no-vig chance, break-even, EV and best book.
Every book	Each side at each book's own line, best first, with "Post on Kalshi at X¢" where a resting order is worth it. This is the line-shopping table.
Derivatives	Team totals and first-half lines once fetched (NFL: Thursday, Saturday and Sunday mornings; college: Fridays). A derivative is a bet only when a retail price beats Pinnacle's own derivative quote.
Alternate lines and teasers	Fair prices at every alternate spread and total within 7 points, from the market's curve and from the projection, and the game's 6- and 7-point teaser legs.

9. This Week's Matchups

A matchup in the dashboards' dark style: each team's projected offense (passing and rushing yards on dials ranked against the week), what its defense is projected to allow, points, attempts and carries against season averages, and full player projections. The Matchups list shows the week's games with implied scores from the betting line. Past weeks' matchups are reachable from Past weeks. "Print matchup" prints one landscape page. This page is for understanding a game; it does not price bets.

10. Players

Player projections

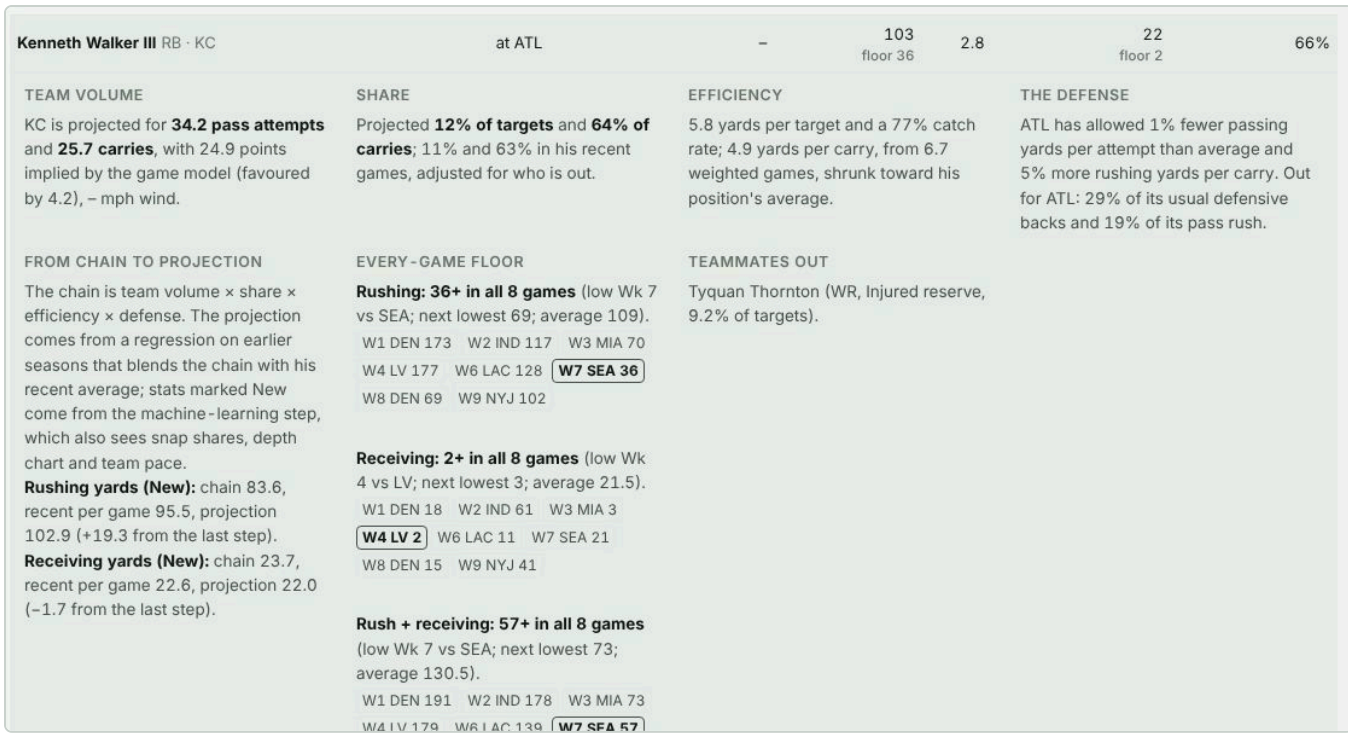

Projected box scores for every quarterback, running back, receiver and tight end with a role this week. Each projection is volume times efficiency: the team's expected passes and runs (from its pace, the opponent, the projected score and wind), the player's share of them (recent games weighted more, with injured teammates' usage passed on to those available), and his own efficiency, adjusted for what this defense allows. Select a player to see how his numbers are built. Under a projection, "floor" is the most yards he has reached in every game he played this season (⚠: this week looks tougher than any of those games; ▲: a teammate's usage is freed up). It is information, not a bet.

Week: Week 10 | Week 11 — Position: All | QB | RB | WR | TE — Team: All teams — Player: Search

Player	Opp	Pass yds	Rush yds	Rec	Rec yds	Anytime TD
Drake Maye QB · NE	at DET	263 floor 178	23 floor 3	–	–	18%

Matthew Stafford QB · LA	at ARI	255 floor 155	6 floor 0	–	–	0%
Justin Herbert QB · LAC	at BAL	207	24	–	–	10%

The Players page (November 11), with each player's every-game floor under his projection.

Projected box scores for every quarterback, running back, receiver and tight end with a role this week: pass yards, rush yards, receptions, receiving yards and anytime-touchdown chance. Each projection is volume times efficiency. Volume is the team's expected plays and the player's share of them; efficiency is his own, adjusted for the defense. Players ruled out get no projection. The superscript after a name is his injury designation (Q questionable, P probable; out or doubtful means no projection). Select a player for how his numbers are built.

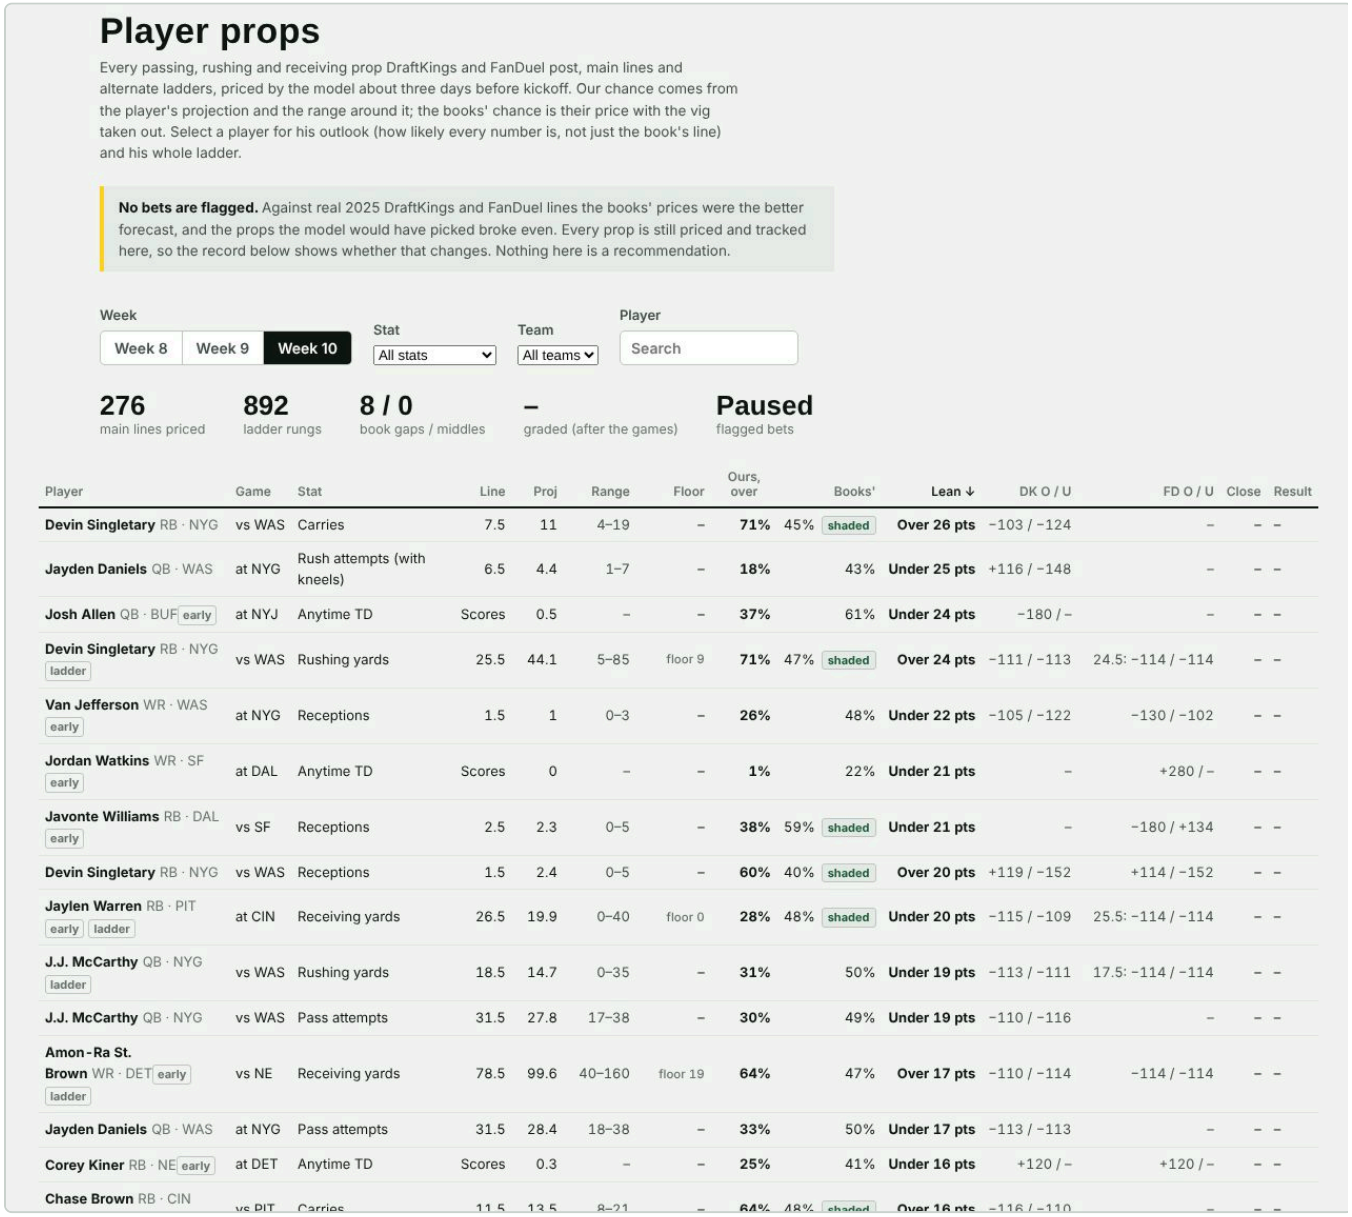

A player opened on November 11 (Kenneth Walker III): team volume, his share, his efficiency, the defense, From chain to projection, the every-game floor, and teammates out.

Team volume	The team's projected pass attempts and carries, from the points the game model implies, the spread and the wind. NEW Since November 4 the NFL pass attempts also use each offense's pass rate over expected and the rate its opponent allows, and carries use what the opponent allows against what its opponents usually run.
Share and efficiency	His share of targets and carries (adjusted for who is out) and his yards per target, catch rate and yards per carry, shrunk toward his position's average.
The defense	What this defense allows, and who is out on it. NEW Projections now also use each defense's record against each position (wide receivers, tight ends, backs as receivers and as runners): what it allowed against what those players were projected for, applied as a small factor (typically 0.94 to 1.03 in the NFL, 0.85 to 1.09 in college, where the card's matchup line reads, for example, "KSU vs RBs: 6% fewer than expected").
From chain to projection NEW	The chain (team volume × share × efficiency × defense), his recent average, and the projection that blends them, for passing, rushing and receiving yards. Stats marked New come from the machine-learning step that also sees snap shares, depth chart and team pace.

None of this is a bet: against DraftKings and FanDuel the books' prop prices are still the better forecast (section 11). The projections feed the Props page, the Parlays page's prop legs and This Week's Matchups.

11. Props (NFL only)

Player props

Every passing, rushing and receiving prop DraftKings and FanDuel post, main lines and alternate ladders, priced by the model about three days before kickoff. Our chance comes from the player's projection and the range around it; the books' chance is their price with the vig taken out. Select a player for his outlook (how likely every number is, not just the book's line) and his whole ladder.

No bets are flagged. Against real 2025 DraftKings and FanDuel lines the books' prices were the better forecast, and the props the model would have picked broke even. Every prop is still priced and tracked here, so the record below shows whether that changes. Nothing here is a recommendation.

Every DraftKings and FanDuel player prop (main lines and alternate ladders), priced by the projections about three days before kickoff. The banner is the most important part: **no bets are flagged.** Against real 2025 lines the books' prices were the better forecast (Brier score 0.118 for the books against 0.135 for ours; lower is better), and the props the model would have picked broke even. Every prop is still priced and tracked so that a future change can be measured. The opening snapshot is now retaken each day until the books have posted yardage lines, so opening prices fill in sooner. NEW Player props are bet, if at all, through the Parlays page, where their chances start from the books' own numbers (section 16). Two things here are book error rather than model opinion and are worth a look: a **book gap** (DraftKings and FanDuel a step apart) and a **middle**.

12. Past weeks and the season to date

Past weeks

Every game's prediction as the board showed it at the last update before kickoff, next to how it turned out.

Week

Week 6 | Week 7 | Week 8 | **Week 9** | Week 10 | Week 11

5-10 Board's side, spreads — **8-7** Board's side, totals — **None** Flagged bets graded — **15 of 15** games graded

BUF at MIN	BUF 23 – 6 MIN	BUF −3, 45.5	BUF by 3.0, 45.6 total	BUF -3 (53%) Won	Over 45.5 (51%) Lost	–

"Side" is whichever side the board's market-adjusted chance favours, with that chance; most are close to 50%, so a week's record is mostly noise. Flagged bets are the ones the board staked. Predictions frozen between 2026-11-06 00:59 UTC and 2026-11-10 01:12 UTC.

Player projections against results

Each player's projection as frozen at kickoff, with what he actually did. Average miss this week: passing yards 55.8 (30 players), rushing yards 17.3 (73 players), receiving yards 19.5 (169 players).

Position: **All** | QB | RB | WR | TE — Team: All teams — Player: Search

Every game as the board saw it at its last update before kickoff, next to how it turned out: the board's spread and total sides with their chances (won or lost), and the flagged bets. Below that, **Player projections against results**: each player's projection frozen at kickoff next to his actual line, paired column by column and sortable, with the week's average miss. Season-to-date tables follow. Archived weeks are never rewritten.

13. Team ratings

Team ratings

Rating is points per game better or worse than an average team on a neutral field, with this week's quarterback. It combines play-by-play efficiency, scoring and what earlier betting lines implied about each team.

Offense against defense

Expected points added per play, adjusted for opponents and weighted toward recent games. Up and to the right is better on both sides of the ball.

#	Team		Rating ↓	Offense	Defense	Market	Quarterback
1	**JAX** 6-2	+8.1		+0.048	−0.035	+4.9	Trevor Lawrence
2	**BUF** 7-1	+6.2		+0.058	−0.014	+3.9	Josh Allen
3	**LA** 5-4	+5.4		+0.046	−0.034	+4.0	Matthew Stafford
4	**KC** 6-2	+5.0		+0.026	−0.002	+3.1	Patrick Mahomes
5	**SF** 7-1	+4.5		+0.068	−0.005	+2.8	Brock Purdy
6	**CIN** 6-2	+4.4		+0.071	+0.026	+3.0	Joe Burrow
7	**SEA** 5-4	+4.0		+0.004	−0.065	+4.1	Drew Lock
8	**MIN** 6-2	+3.6		−0.063	−0.072	+0.9	Kirk Cousins
9	**DET** 6-2	+3.5		+0.026	+0.009	+2.5	Jared Goff
10	**HOU** 3-5	+3.4		+0.014	−0.011	+3.3	C.J. Stroud
11	**CHI** 7-2	+3.3		+0.037	−0.029	+1.5	Caleb Williams
12	**DEN** 7-2	+3.1		+0.012	−0.025	+2.7	Bo Nix
13	**PIT** 6-2	+2.5		−0.001	−0.012	−0.1	Aaron Rodgers
14	**NE** 5-4	+2.1		+0.019	+0.004	+1.6	Drake Maye
15	**TB** 3-6	+1.8		−0.031	−0.062	−1.9	Baker Mayfield
16	**DAL** 4-5	+1.3		+0.040	+0.056	+2.4	Dak Prescott
17	**GB** 6-3	+1.2		+0.033	−0.031	+0.6	Jordan Love
18	**CAR** 3-5	−1.6		+0.014	+0.037	−0.9	Bryce Young
19	**BAL** 4-5	−1.7		−0.008	−0.006	+0.3	Jacoby Brissett
20	**WAS** 2-5-1	−2.2		−0.016	+0.020	−2.0	Jayden Daniels
21	**ATL** 3-6	−2.4		−0.012	+0.001	−1.4	Michael Penix Jr.
22	**NO** 3-5	−2.6		−0.015	+0.019	−1.8	Tyler Shough
23	**IND** 2-7	−2.7		−0.044	+0.021	−1.9	Daniel Jones
24	**CLE** 5-4	−3.5		−0.057	−0.014	−3.7	Deshaun Watson
25	**LAC** 0-8	−3.8		−0.085	−0.008	−1.4	Justin Herbert
26	**NYG** 5-2-1	−4.0		+0.005	−0.004	−2.6	J.J. McCarthy

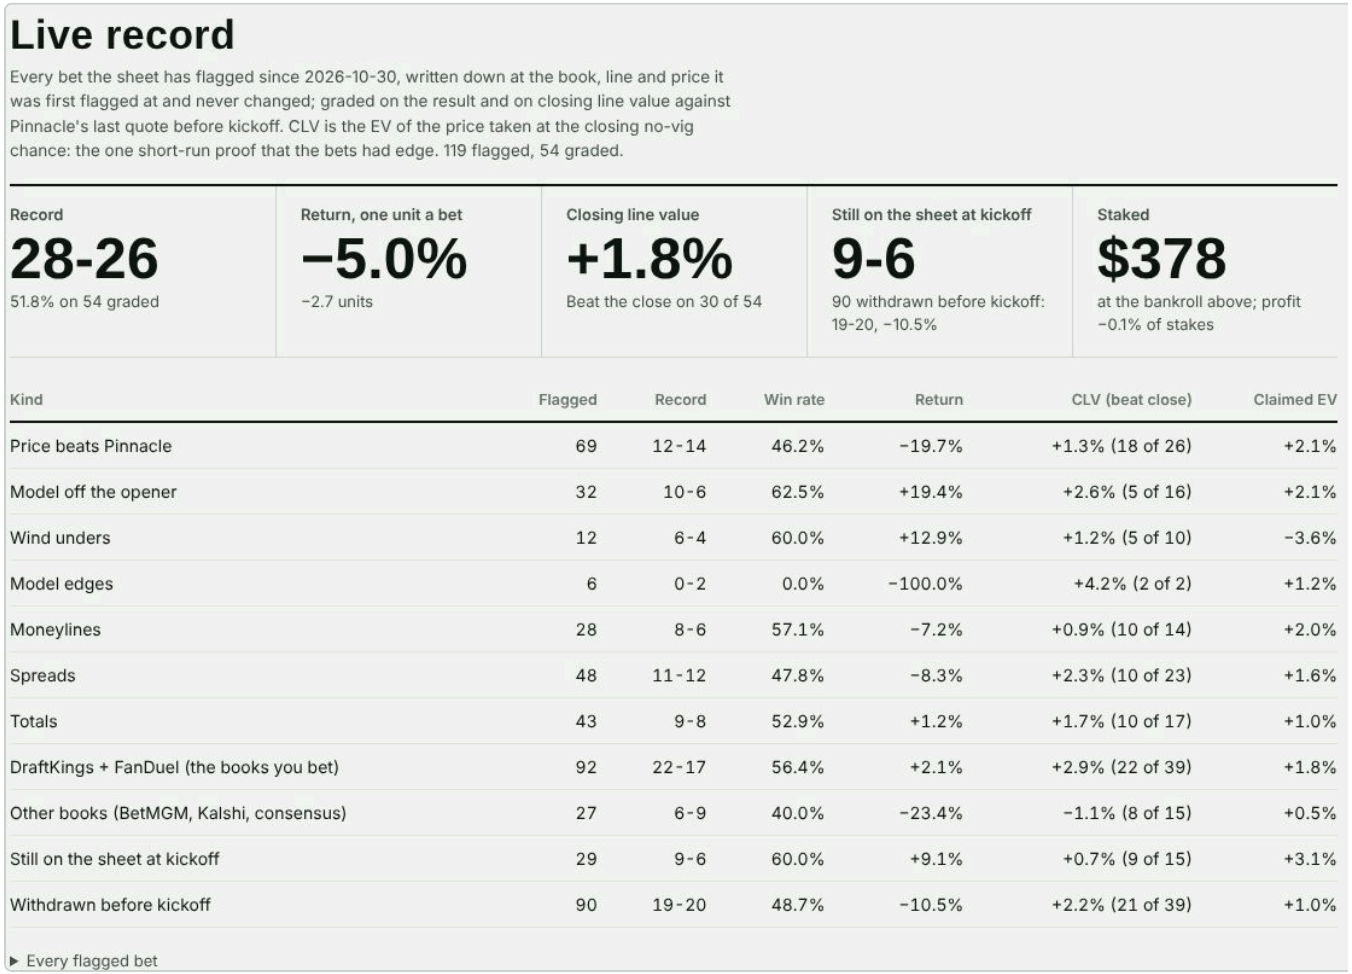

Each team's rating in points against an average team on a neutral field, with this week's quarterback: offense and defense in EPA per play adjusted for opponents, and the rating the betting market implies. The chart puts offense across and defense up; up and to the right is good at both. When the model's rating and the market's differ by a lot, that team drives most of the model's disagreements.

14. Model record: the Live record, the Best Bets record, closing line value and the backtest

The Model record page carries three records. They answer three different questions.

Record	What it counts	The question it answers
Live record	Every bet the sheet ever flagged, at the first price it was flagged at; graded on the result and on closing line value.	If you acted on the board's first word, how did you do?
Best Bets record	Only the bets on the Best bets card as it stood when each game kicked off, at the card's book, line, price and stake.	If you bet the card, how did you do?
Track record (the backtest)	Every game since 2014 (NFL) or 2017 (college), projected out of sample and graded at the closing price.	Is the model any good, and which kinds of bets have paid?

The Live record

Live record

Every bet the sheet has flagged since 2026-10-30, written down at the book, line and price it was first flagged at and never changed; graded on the result and on closing line value against Pinnacle's last quote before kickoff. CLV is the EV of the price taken at the closing no-vig chance: the one short-run proof that the bets had edge. 119 flagged, 54 graded.

Record	Return, one unit a bet	Closing line value	Still on the sheet at kickoff	Staked
28-26	**−5.0%**	**+1.8%**	**9-6**	**$378**
51.8% on 54 graded	−2.7 units	Beat the close on 30 of 54	90 withdrawn before kickoff: 19-20, −10.5%	at the bankroll above; profit −0.1% of stakes

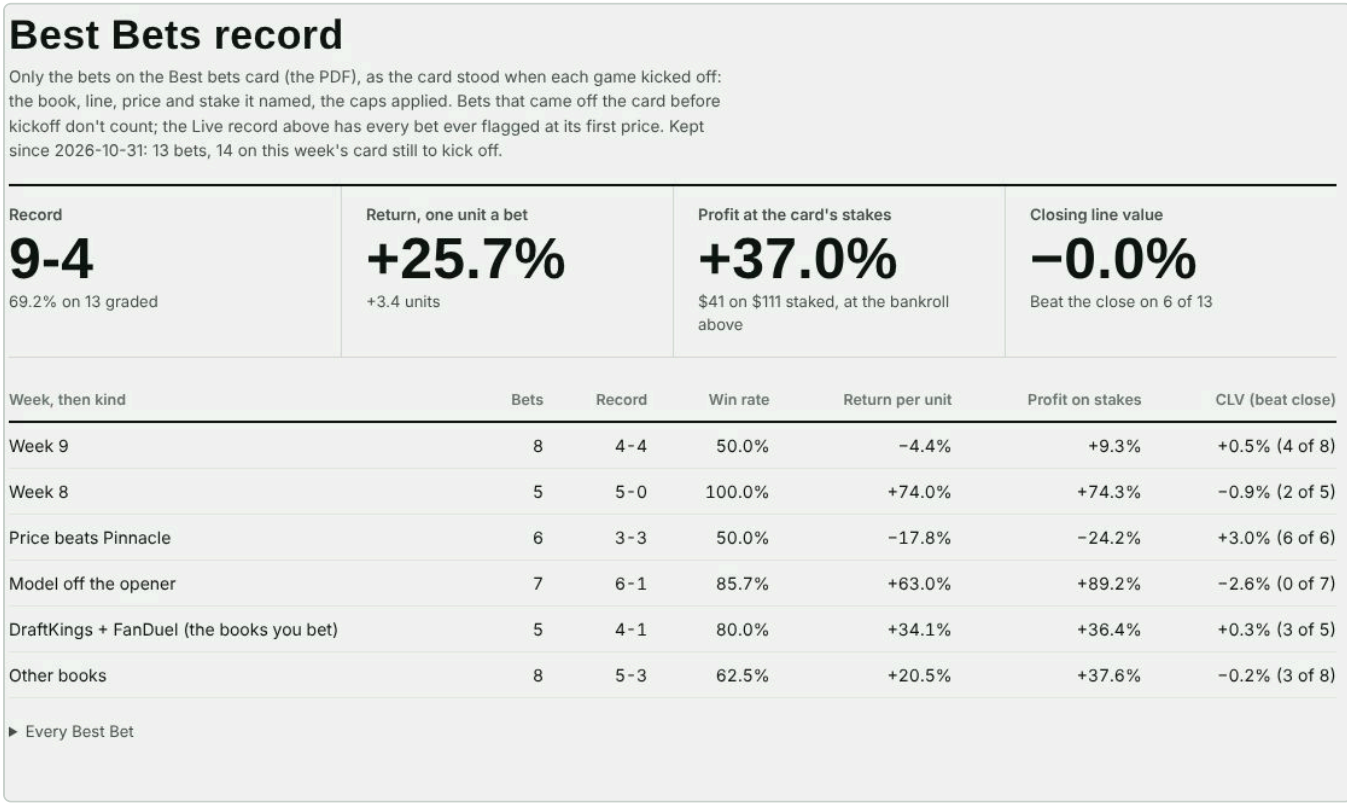

Kind	Flagged	Record	Win rate	Return	CLV (beat close)	Claimed EV
Price beats Pinnacle	69	12-14	46.2%	−19.7%	+1.3% (18 of 26)	+2.1%
Model off the opener	32	10-6	62.5%	+19.4%	+2.6% (5 of 16)	+2.1%
Wind unders	12	6-4	60.0%	+12.9%	+1.2% (5 of 10)	−3.6%
Model edges	6	0-2	0.0%	−100.0%	+4.2% (2 of 2)	+1.2%
Moneylines	28	8-6	57.1%	−7.2%	+0.9% (10 of 14)	+2.0%
Spreads	48	11-12	47.8%	−8.3%	+2.3% (10 of 23)	+1.6%
Totals	43	9-8	52.9%	+1.2%	+1.7% (10 of 17)	+1.0%
DraftKings + FanDuel (the books you bet)	92	22-17	56.4%	+2.1%	+2.9% (22 of 39)	+1.8%
Other books (BetMGM, Kalshi, consensus)	27	6-9	40.0%	−23.4%	−1.1% (8 of 15)	+0.5%
Still on the sheet at kickoff	29	9-6	60.0%	+9.1%	+0.7% (9 of 15)	+3.1%
Withdrawn before kickoff	90	19-20	48.7%	−10.5%	+2.2% (21 of 39)	+1.0%

▶ Every flagged bet

The NFL Live record on November 11: 119 flagged, 54 graded, 28-26, −5.0% a unit, closing line value +1.8%. The DraftKings + FanDuel row is 22-17 with closing line value +2.9%; the other books are 6-9 and −1.1%.

Tiles for the record, return per unit, closing line value and stake, then a row per kind and per market. It reads both ways: the tile **Still on the sheet at kickoff** counts bets the board kept to the end, and the table adds rows for **kept** and **withdrawn**. Withdrawn bets are labelled in the row list. In a few weeks this tells you whether the board's changes of mind (a quarterback ruled out, a line that moved to the model) are adding value. On November 11 the kept bets were 9-6 and the withdrawn ones 19-20: still too few to say anything. From November 11 the table also has **DraftKings + FanDuel (the books you bet)** and **Other books**: the board flags prices at BetMGM and Kalshi as well, so the first of those rows is the record of the bets you could actually have placed (22-17 on November 11, against 6-9 at the other books). The Best Bets record has the same two rows. On the college board the closing line value column was empty until November 11; it is filled now, for past bets too.

The Best Bets record

Best Bets record

Only the bets on the Best bets card (the PDF), as the card stood when each game kicked off: the book, line, price and stake it named, the caps applied. Bets that came off the card before kickoff don't count; the Live record above has every bet ever flagged at its first price. Kept since 2026-10-31: 13 bets, 14 on this week's card still to kick off.

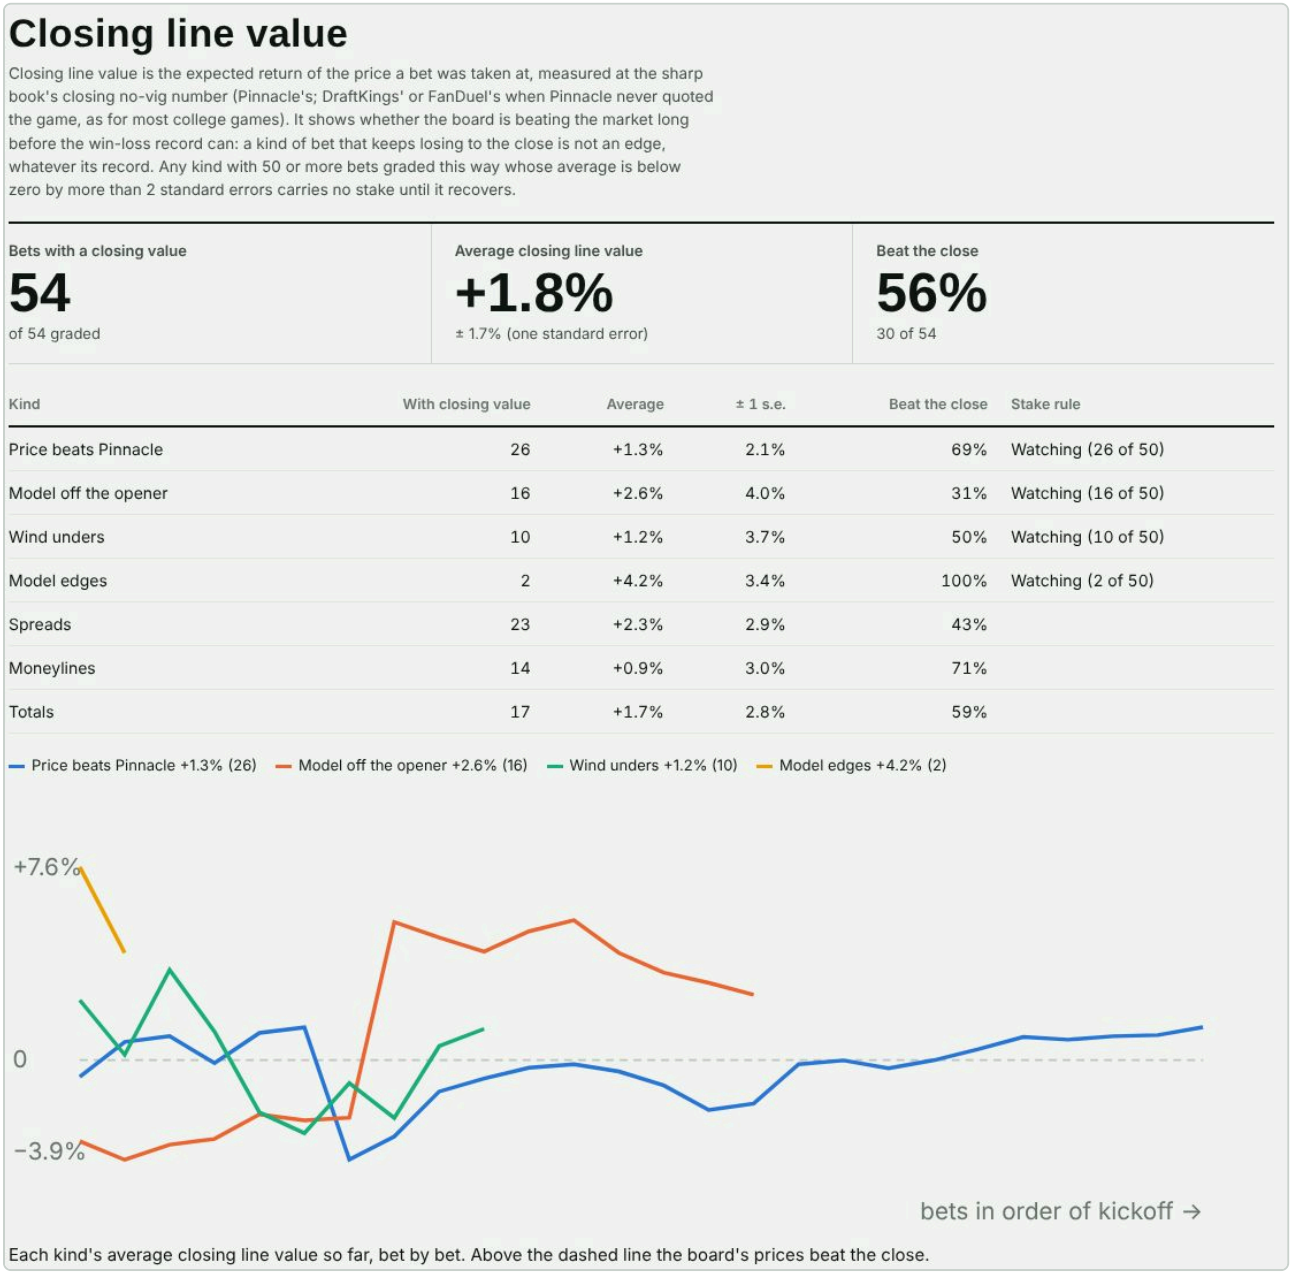

Record	Return, one unit a bet	Profit at the card's stakes	Closing line value
9-4	**+25.7%**	**+37.0%**	**−0.0%**
69.2% on 13 graded	+3.4 units	$41 on $111 staked, at the bankroll above	Beat the close on 6 of 13

Week, then kind	Bets	Record	Win rate	Return per unit	Profit on stakes	CLV (beat close)
Week 9	8	4-4	50.0%	−4.4%	+9.3%	+0.5% (4 of 8)
Week 8	5	5-0	100.0%	+74.0%	+74.3%	−0.9% (2 of 5)
Price beats Pinnacle	6	3-3	50.0%	−17.8%	−24.2%	+3.0% (6 of 6)
Model off the opener	7	6-1	85.7%	+63.0%	+89.2%	−2.6% (0 of 7)
DraftKings + FanDuel (the books you bet)	5	4-1	80.0%	+34.1%	+36.4%	+0.3% (3 of 5)
Other books	8	5-3	62.5%	+20.5%	+37.6%	−0.2% (3 of 8)

▶ Every Best Bet

Started October 31, 2026. Each build logs the card: a bet that appears, changes book, line, price or stake, or leaves. When a game kicks off, the last version of its card counts. Tiles show the record, return per unit, **profit at the card's stakes** (what your bankroll actually did) and CLV. The table shows the record by week, then by kind, and the full list is underneath. The Best bets PDF quotes the record so far in its header. On November 11 the NFL card was 9-4 (+25.7% a unit, $41 on $111 staked, closing line value 0.0%) and the college card 44-42 (−2.1% a unit, closing line value −2.4%).

Closing line value: the number to watch first NEW

The Closing line value section on November 11: 54 NFL bets with a closing value, averaging +1.8% ± 1.7%; each kind's stake rule ("Watching 26 of 50"), and each kind's running average, bet by bet.

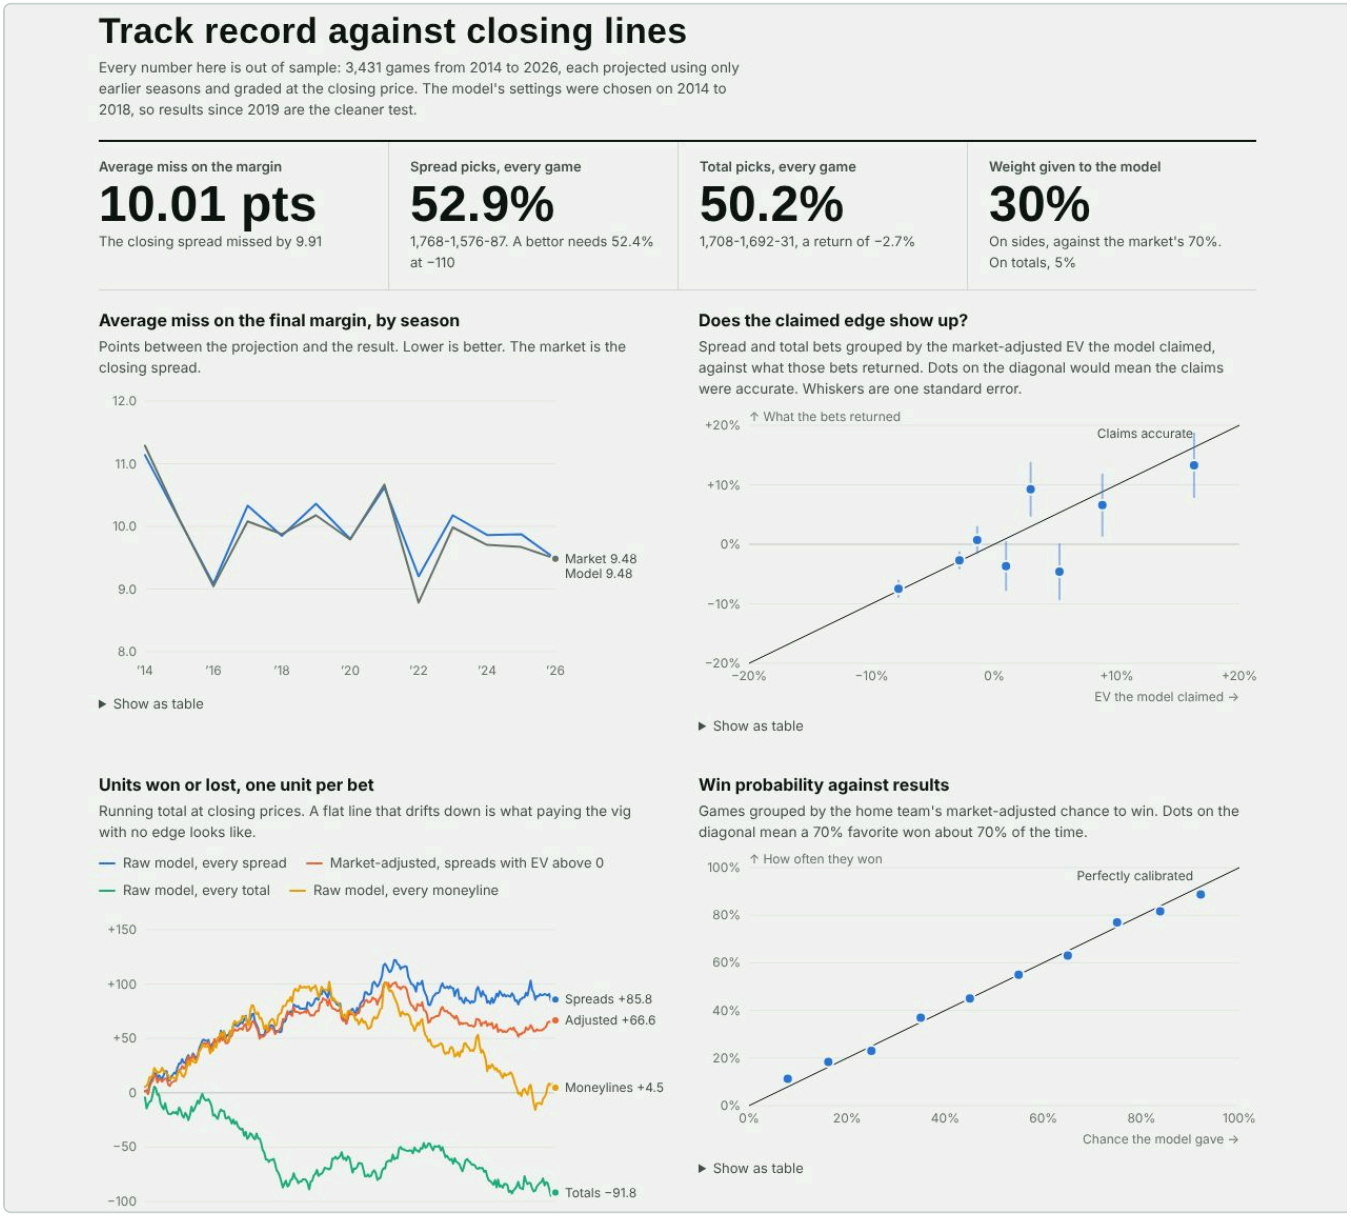

CLV is the EV of the price you took, measured at the closing no-vig chance. It's the one short-run proof that bets had edge: a bettor who beats the close consistently wins in the long run, whatever this week's results say. Fifty bets won't separate skill from luck on wins and losses; they will on CLV. Price-tier bets should show positive CLV almost every time. Opener bets should show it whenever the line moved toward them, which is the whole idea.

The section has its own tiles (bets with a closing value, the average with its standard error, how often the close was beaten), a table by kind and by market, and a chart of each kind's running average. The **Stake rule** column says where each kind stands under the closing-line-value guard (section 2):

"Watching (n of 50)" until it has 50 graded bets, then staked, or muted if it is losing to the close by more than two standard errors. The close is Pinnacle's last quote before kickoff; where Pinnacle never quoted a game, as for most college games, DraftKings' and then FanDuel's closing no-vig number is used.

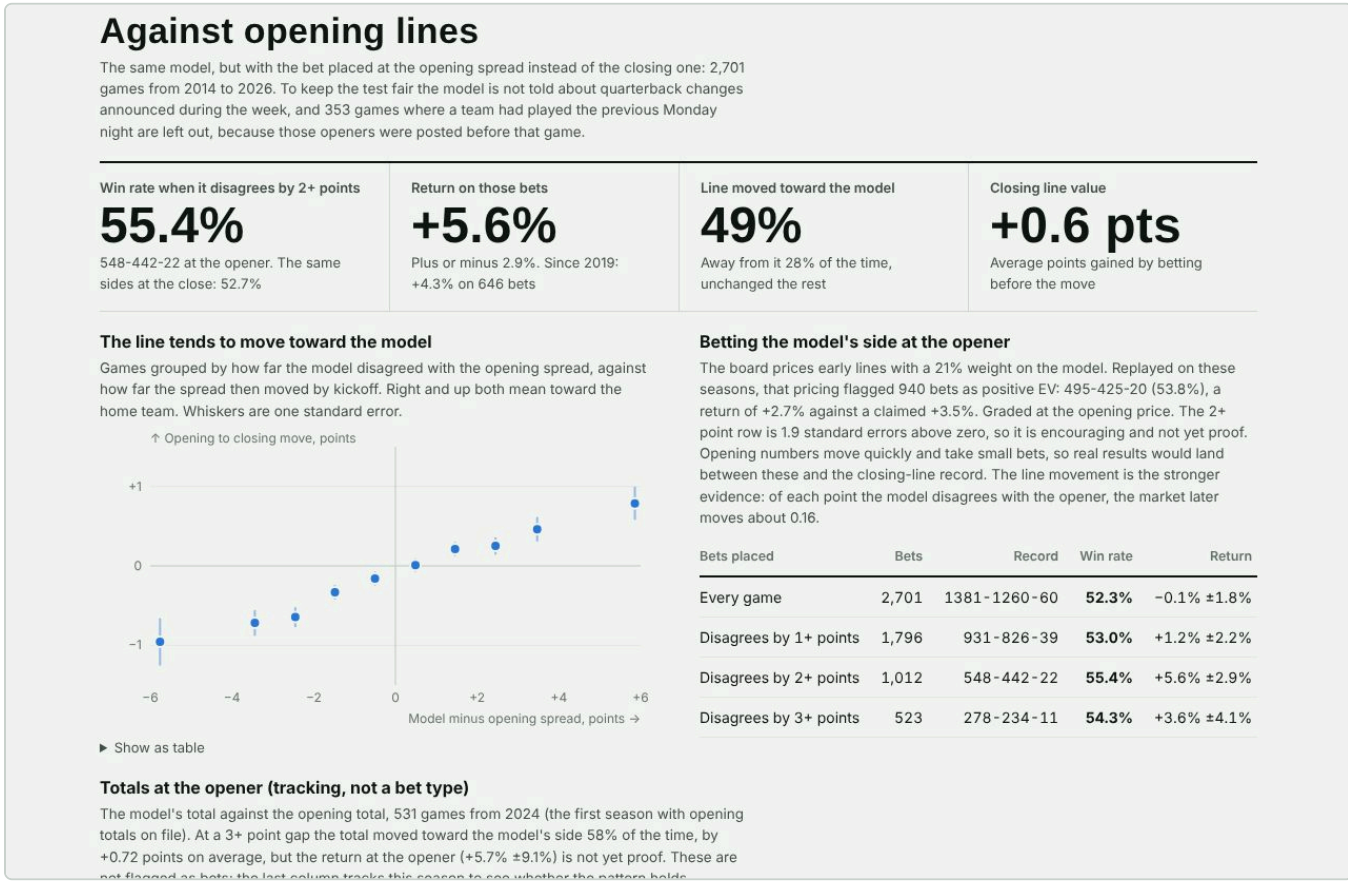

> **How I read it on November 11**
>
> Still early. Across 54 NFL bets the board has beaten the close by 1.8% ± 1.7%: encouraging, not proven. Price bets are +1.3% on 26 (18 beat the close) while losing on results (12-14): the closing line says the prices were fair bets, and the results are noise so far. Opener bets are 10-6 and average +2.6%, but only 5 of 16 beat the close, so that average rests on a few big moves. On the college board, where this table was empty until November 11, it reads −0.2% ± 0.8% on 151 bets, with the price tier at −0.1% on 92: there the claimed edge has not shown up, and the price tier's stake rule already reads "Close to the line". The row that matters most to you is on the Live record above it: DraftKings + FanDuel, +2.9% on 39 NFL bets and +0.8% on 110 college bets.

The backtest

Every number is out of sample: 3,431 NFL games from 2014 to 2026, each projected using only earlier seasons and graded at the closing price. Settings were chosen on 2014–2018, so results since 2019 are the cleaner test. The headline tiles: average miss on the margin 10.01 points (the closing spread 9.91), spread picks every game 52.9%, total picks 50.2%, weight given to the model 30% on sides and 5% on totals. The backtest is rerun in full each Tuesday (NFL) and Monday (college), so model changes show up in these tiles from the next full run. A **By part of the season** NEW table (now on both boards) splits the holdout seasons into weeks 1–4, 5–9, 10–14, 15–18 and the playoffs, with the average miss for the raw model, the adjusted projection and the line, and how often each picked the winner. The charts show the miss by season, whether claimed EV showed up (the dots should sit on the diagonal; they mostly don't), units won or lost, and calibration of win chances (which is good).

Wind unders and against opening lines

Against opening lines

The same model, but with the bet placed at the opening spread instead of the closing one: 2,701 games from 2014 to 2026. To keep the test fair the model is not told about quarterback changes announced during the week, and 353 games where a team had played the previous Monday night are left out, because those openers were posted before that game.

Win rate when it disagrees by 2+ points	Return on those bets	Line moved toward the model	Closing line value
55.4%	**+5.6%**	**49%**	**+0.6 pts**
548-442-22 at the opener. The same sides at the close: 52.7%	Plus or minus 2.9%. Since 2019: +4.3% on 646 bets	Away from it 28% of the time, unchanged the rest	Average points gained by betting before the move

The line tends to move toward the model

Games grouped by how far the model disagreed with the opening spread, against how far the spread then moved by kickoff. Right and up both mean toward the home team. Whiskers are one standard error.

▸ Show as table

Betting the model's side at the opener

The board prices early lines with a 21% weight on the model. Replayed on these seasons, that pricing flagged 940 bets as positive EV: 495-425-20 (53.8%), a return of +2.7% against a claimed +3.5%. Graded at the opening price. The 2+ point row is 1.9 standard errors above zero, so it is encouraging and not yet proof. Opening numbers move quickly and take small bets, so real results would land between these and the closing-line record. The line movement is the stronger evidence: of each point the model disagrees with the opener, the market later moves about 0.16.

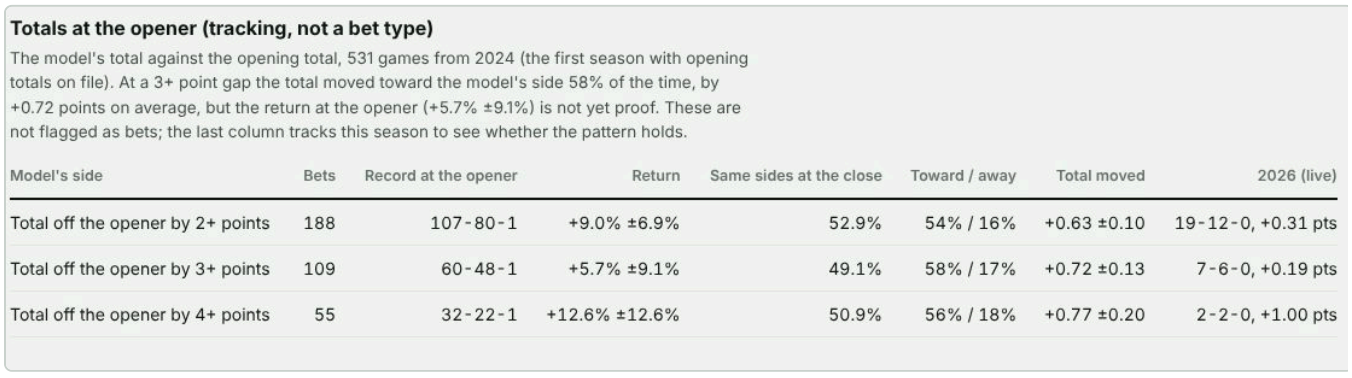

Bets placed	Bets	Record	Win rate	Return
Every game	2,701	1381-1260-60	**52.3%**	−0.1% ±1.8%
Disagrees by 1+ points	1,796	931-826-39	**53.0%**	+1.2% ±2.2%
Disagrees by 2+ points	1,012	548-442-22	**55.4%**	+5.6% ±2.9%
Disagrees by 3+ points	523	278-234-11	**54.3%**	+3.6% ±4.1%

Totals at the opener (tracking, not a bet type)

The model's total against the opening total, 531 games from 2024 (the first season with opening totals on file). At a 3+ point gap the total moved toward the model's side 58% of the time, by +0.72 points on average, but the return at the opener (+5.7% ±9.1%) is not yet proof. These are not flagged as bets; the last column tracks this season to see whether the pattern holds.

Against opening lines replays the model against the opening spread: 2,701 games, with games after a team's Monday-night game left out because their openers were posted before that game. At 2+ points of disagreement the model's side won 55.4% at the opener (548-442-22, +5.6% ± 3.0%; +4.3% ± 3.7% on 646 bets since 2019) and 52.7% at the close. The line moved toward the model 49% of the time and away from it 28%. That table is the basis of the opener tier, the Line movement section and the phone alerts. **Wind unders** shows the 10–19 mph record by era. **Key numbers** shows how often NFL games land on each margin (3 and 7 above all), which is why a half point through 3 is worth so much and why Wong legs exist.

Totals at the opening total NEW

Totals at the opener (tracking, not a bet type)

The model's total against the opening total, 531 games from 2024 (the first season with opening totals on file). At a 3+ point gap the total moved toward the model's side 58% of the time, by +0.72 points on average, but the return at the opener (+5.7% ±9.1%) is not yet proof. These are not flagged as bets; the last column tracks this season to see whether the pattern holds.

Model's side	Bets	Record at the opener	Return	Same sides at the close	Toward / away	Total moved	2026 (live)
Total off the opener by 2+ points	188	107-80-1	+9.0% ±6.9%	52.9%	54% / 16%	+0.63 ±0.10	19-12-0, +0.31 pts
Total off the opener by 3+ points	109	60-48-1	+5.7% ±9.1%	49.1%	58% / 17%	+0.72 ±0.13	7-6-0, +0.19 pts
Total off the opener by 4+ points	55	32-22-1	+12.6% ±12.6%	50.9%	56% / 18%	+0.77 ±0.20	2-2-0, +1.00 pts

Under Against opening lines, a tracking table replays the model's total against the opening total (531 games since 2024, the first season with opening totals on file) at 2+, 3+ and 4+ point gaps: the record and return at the opener, the same sides at the close, how often and how far the total moved toward the model, and a column for this season. At 3+ points the total moved toward the model 58% of the time, by 0.72 points on average, but the return at the opener (+5.7% ± 9.1%) is nowhere near proof. **These are not bets**, and nothing on the sheet uses them. The live column is there to see whether the pattern holds.

15. The College board: what is different

Bet sheet

41 bets this week, by what the edge is made of: 5 where a price beats Pinnacle, 2 where the model is off the opener, 34 on the model alone. Moneylines are only listed when a price beats the sharp line: since 2021 they have lost at every claimed edge. Stakes are quarter Kelly, and the model's own edges carry no stake: its edge against consensus lines did not hold against Pinnacle's real 2024-2025 numbers (Model record, method) (price bets are sized against the sharp line, so they still carry one). Where an EV comes from the model, the figure shown is record-adjusted: it counts none of the model's edge, since none has shown up in graded bets: the market's own number; the model's own claim is the small figure under it. Weekly cap 10% of bankroll; this week 5.1%. Book prices are 11 hours old: price bets are greyed until the next snapshot.

Download the best bets (PDF) | Print view | Model leans, not bets (PDF) | Print the leans

Data as of: board built 2026-11-11 19:36 UTC; book prices 2026-11-11 08:59 UTC; injury designations checked 2026-11-11. Lines move: check the book before betting.

Price beats Pinnacle (5)

The book's price beats the sharp book's own no-vig number at this line by at least 1% per dollar, before the model says anything. This is the one kind of bet that makes money with no model at all; take it at the book named, now.

Pick	Where	EV per $1	What the model's number is made of	Line and timing	Record of this kind	
BYU ML BAY @ BYU, Sat 3:30 PM (in 3 days)	FanDuel −265	+1.0%	**Model BYU −10.6 vs BYU −7 (+3.6, +3.1 at open):** ratings +4.3, home field +2.7, Mid-season coaching change +2.1	**Check the price.** These prices are 11 hours old: a price edge is usually gone within hours. Take it only if the book still shows this price or better. Opened BYU −7.5 (opener), now BYU −7: moved 0.5 against this side. Pinnacle since 11/08: BYU −8 → BYU −7 (1 move).	+EV against the sharp line by construction; the only bucket that needs no model. Live since 2026-10-30: 44-48, −13.0% per unit, CLV −0.1% on 92.	$7
ARIZ +2.5 UTAH @ ARIZ, Sat 7:30 PM (in 3 days)	Kalshi +2.5 +117 (+109 net) Post on Kalshi at 48¢	+1.8%	**Model UTAH −3.6 vs UTAH −2.5 (−1.1, −2.1 at open):** ratings −6.7, home field +2.7, Talent and returning production +0.8	**Check the price.** These prices are 11 hours old: a price edge is usually gone within hours. Take it only if the book still shows this price or better. Opened UTAH −1.5 (opener), now UTAH −2.5: moved 1 against this side.	+EV against the sharp line by construction; the only bucket that needs no model. Live since 2026-10-30: 44-48, −13.0% per unit, CLV −0.1% on 92.	$4
WYO ML WYO @ UTEP, Sat 10:00 PM (in 3 days)	BetMGM −300	+1.1%	**Model WYO −6.7 vs WYO −8.5 (−1.8, −3.3 at open):** ratings −10.9, home field +2.7, WYO quarterback +1.6	**Check the price.** These prices are 11 hours old: a price edge is usually gone within hours. Take it only if the book still shows this price or better. Opened WYO −10 (opener), now WYO −8.5: moved 1.5 against this side. Pinnacle since 11/09: WYO −9 → WYO −8.5 (2 moves).	+EV against the sharp line by construction; the only bucket that needs no model. Live since 2026-10-30: 44-48, −13.0% per unit, CLV −0.1% on 92.	$9
WYO −7.5 WYO @ UTEP, Sat 10:00 PM (in 3 days)	Kalshi −7.5 +100 (−107 net) Post on Kalshi at 51¢	+1.0%	**Model WYO −6.7 vs WYO −8.5 (−1.8, −3.3 at open):** ratings −10.9, home field +2.7, WYO quarterback +1.6	**Check the price.** These prices are 11 hours old: a price edge is usually gone within hours. Take it only if the book still shows this price or better. Opened WYO −10 (opener), now WYO −8.5: moved 1.5 against this side. Pinnacle since 11/09: WYO −9 → WYO −8.5 (2 moves).	+EV against the sharp line by construction; the only bucket that needs no model. Live since 2026-10-30: 44-48, −13.0% per unit, CLV −0.1% on 92.	$3
OKST ML TTU @ OKST, Sat 9:30 PM (in 3 days)	FanDuel −150	+1.9%	**Model TTU −3.2 vs OKST −3.5 (−6.7, +12.3 at open):** Talent and returning production −3.2, home field +2.7, TTU quarterback −2.3	**Check the price.** These prices are 11 hours old: a price edge is usually gone within hours. Take it only if the book still shows this price or better. Opened TTU −15.5 (opener), now OKST −3.5: moved 19 toward this side.	+EV against the sharp line by construction; the only bucket that needs no model. Live since 2026-10-30: 44-48, −13.0% per unit, CLV −0.1% on 92.	$7

The college Bet sheet on November 11: five price bets (greyed, "Check the price": the prices were 11 hours old), two opener totals, then 34 model edges listed with no stake, whose record-adjusted EV is the market's own number with the model's claim under it. The week uses 5.1% of the cap.

Model edges: no stake NEW	The haircut measured on consensus lines is 52% (2,434 bets 2018–2025: claimed +3.6%, realized +1.7%), but regraded against Pinnacle's real 2024–2025 lines the college model's edge did not hold. Since November 1 the haircut is capped at 0: model edges are still listed on the college sheet and the Best bets card (so they are recorded and graded), but they carry no stake. Price bets and opener totals are sized as before. The Best Bets record's college Week 9 model-edge stakes were set before this change.
Opener tier: totals only	College spreads off the opener have lost on the holdout seasons at every threshold below 5 points, so no college spread is ever in the opener tier. College totals 3+ points off the opener: 55.3%, +5.6% on 1,288 bets since 2021. A side marked Missed there means the total has already moved to the model.
Line movement	Lists college totals 3+ and spreads 5+ off the opener (735 bets, 54.3%, +3.6%). Expect many more rows than the NFL.
No wind tier	The college wind record (53.5%, +2.2% ± 2.3%) is not strong enough to bet on its own.
Props	The college board has no Props page. Live DraftKings and FanDuel college player props NEW are fetched for the Parlays page and priced at the books' own numbers there (section 16).
Backtest	6,918 games from 2017 to 2026; holdout from 2021. Average miss 12.41 against the market's 12.16 (about even from week 6 on).
Quarterbacks and injuries	College starters come from the CFB dashboard's starter list, and injury designations from Covers.com, checked each morning. NEW A College availability log also records every change to those designations, ESPN's injury lists and the SEC, ACC, Big 12 and Big Ten availability reports, with the time each change was first seen. It is history for testing; the board still uses Covers.
Prices and the close	The same five books. Many smaller-conference games have no Pinnacle quote; those use the consensus line, and the card says "no sharp quote". For closing line value, those games use DraftKings' and then FanDuel's close.
How the spread is built NEW	Since November 4 the college spread card has two more rows, **Coverage defenders out** (the share of a team's main coverage defenders who recorded nothing in its last game) and **Mid-season coaching change**, and "Returning defensive production" is now **Returning production**. Section 17 lists the other college model changes.

Line movement

The edge the backtests found is the line moving to the model. These are the sides the model is far enough off the opener to be in that bucket (3+ on totals, 5+ on spreads), and how far the market has come since. Live: the gap at today's line still clears the threshold; bet it now. Partly gone: the line has come part of the way, and the edge left is smaller than the record says. Missed: the line has reached the model. Once it has moved, the 6-point teaser leg on the same side is the way in when it clears a two-team teaser at −120 (73.9%). This week: 19 live, 11 partly gone, 9 missed.

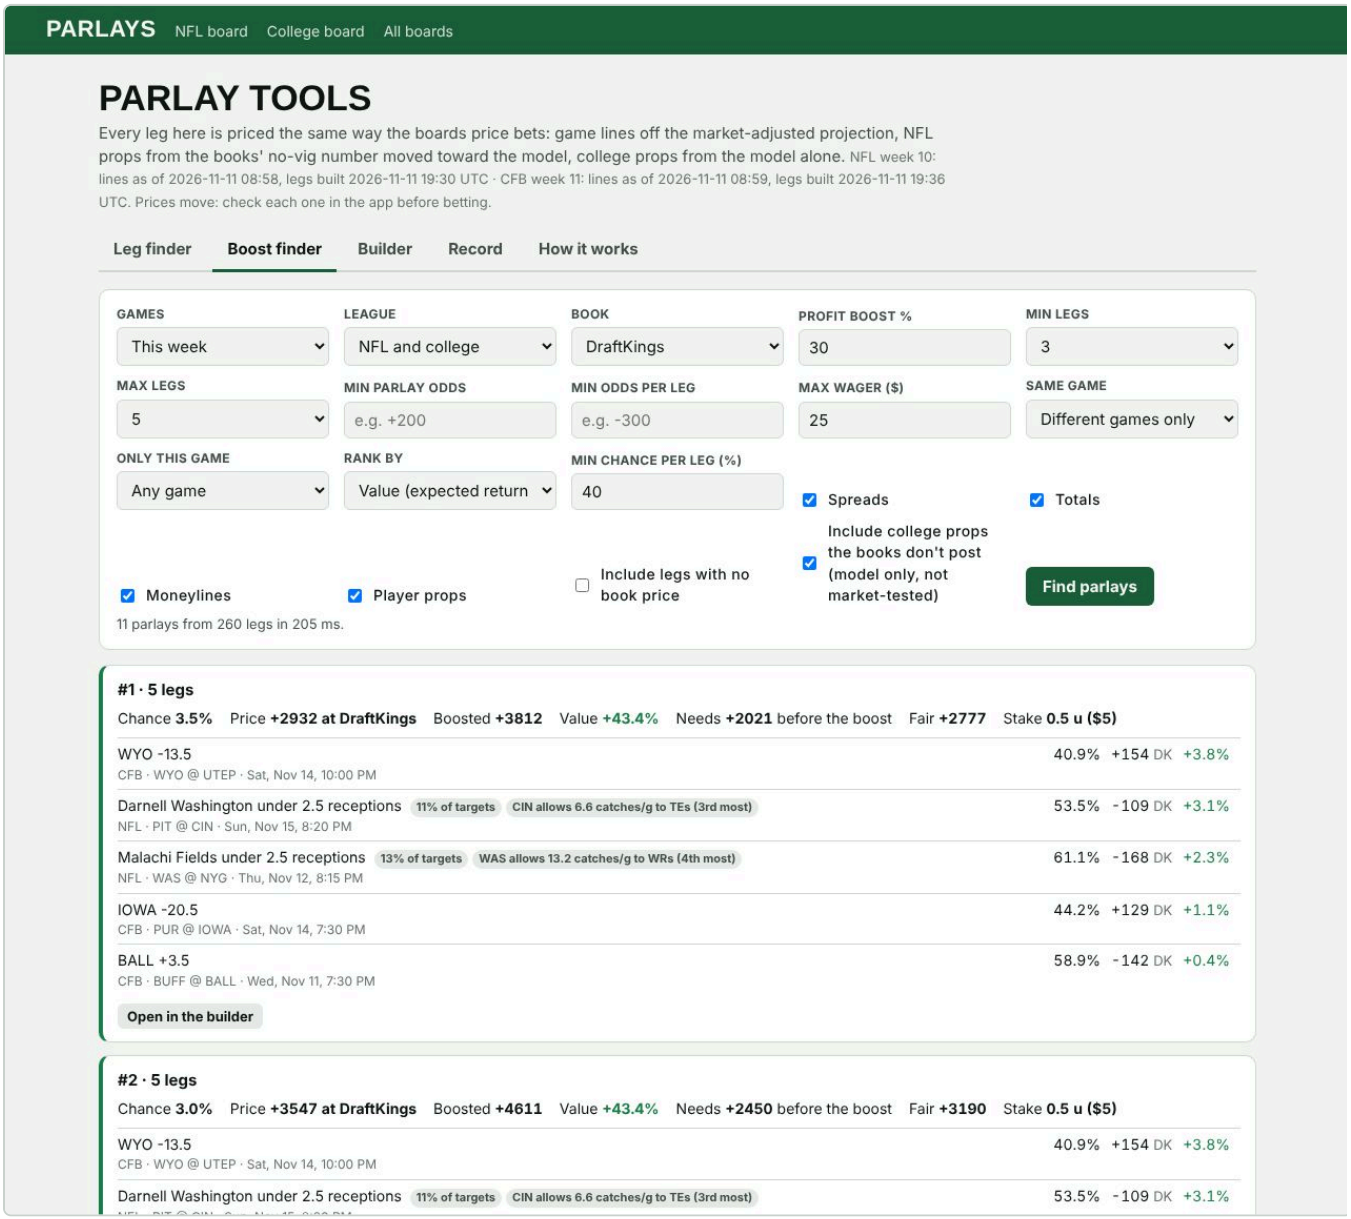

Lines as of the board build (book prices 2026-11-11 08:59 UTC).

Side	Model	Opened	Now	Left	Status	Teaser leg	Record of this kind
ND -29 BC @ ND, Sat 3:30 PM (in 3 days)	−37.9	−31.5	−29 (2.5 against)	+8.9	**Live**	ND −23, 66.5%, short of 73.9%	Spreads 5+ off the opener: 54.3%, +3.5% on 735.
Over 50 AUB @ MSST, Sat 12:00 PM (in 3 days)	58.3	51.5	50 (1.5 against)	+8.3	**Live**	Over 44, 65.8%, short of 73.9%	Totals 5+ off the opener: 55.0%, +5.0% on 412.

College Line movement (November 11): 19 sides live, 11 partly gone, 9 missed.

16. The Parlays page: leg finder, boost finder, builder and record NEW

The Parlays page (rhyman7.github.io/fb-value-board/docs/parlays.html, linked from the landing page under both boards) builds and prices parlays from both boards' legs: spreads, totals, moneylines, moved lines and player props, NFL and college, at DraftKings and FanDuel. It has five tabs.

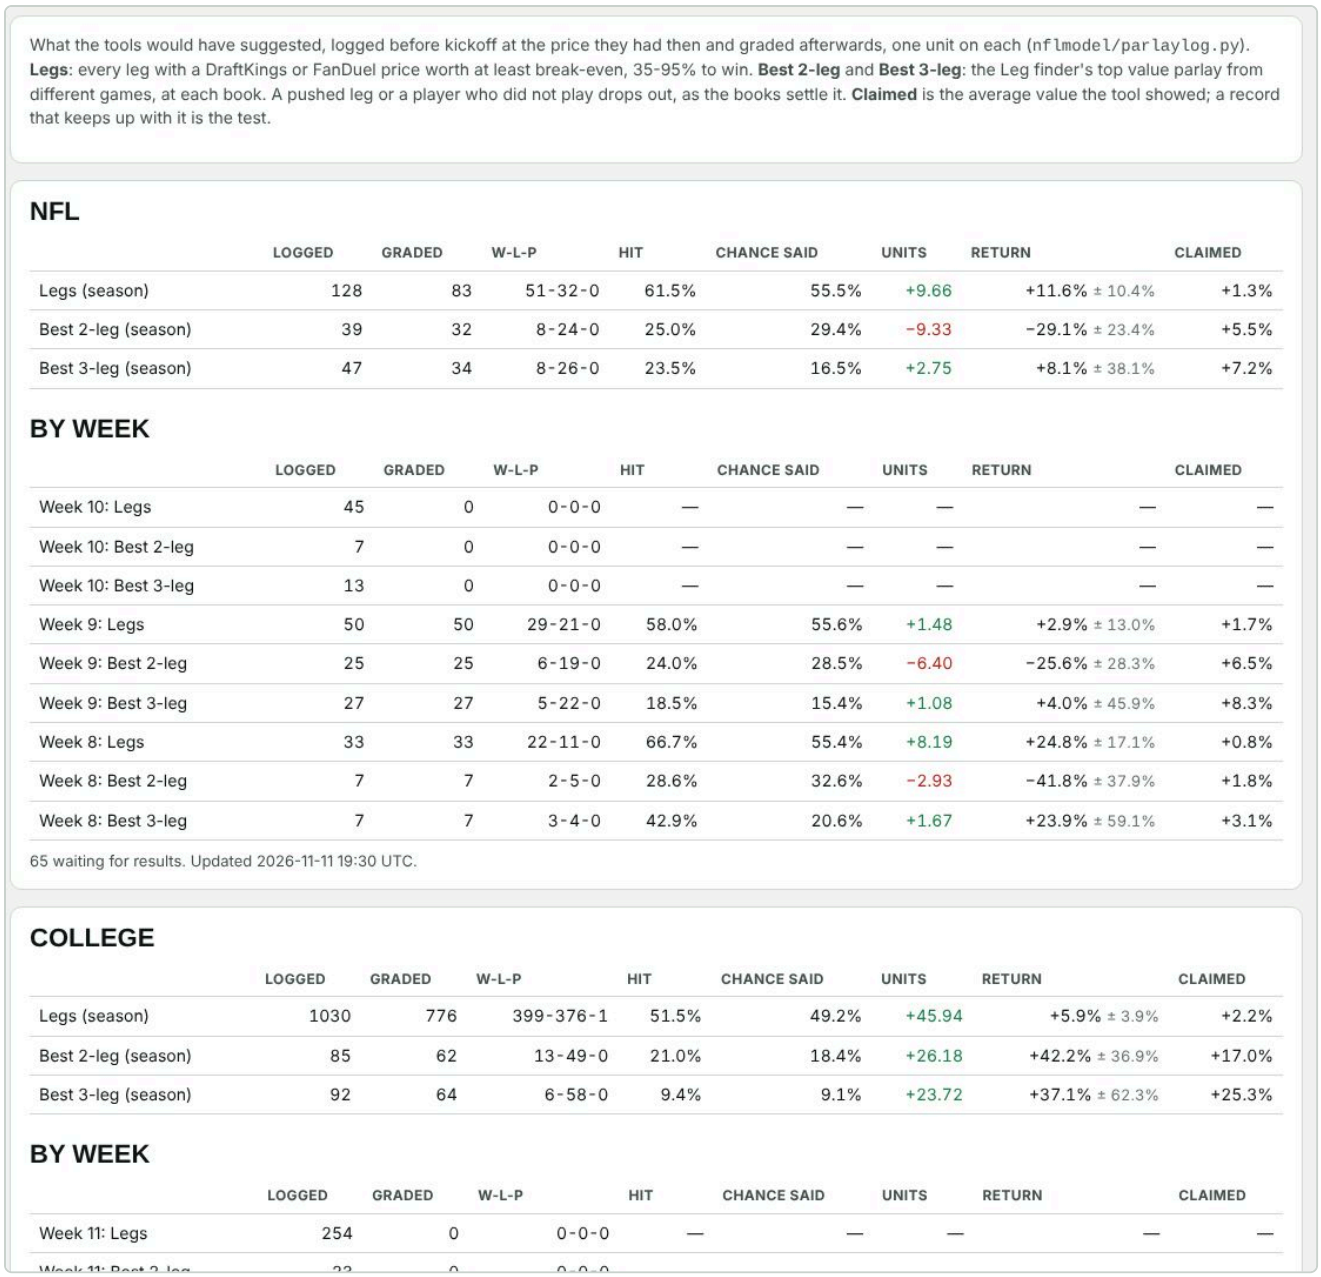

The Boost finder on November 11: a 30% profit boost at DraftKings, $25 maximum wager, 3 to 5 legs from different games. The top card is a 5-leg parlay at +2932, boosted to +3812, worth +43.4% with a 3.5% chance of cashing and a half-unit stake.

Leg finder	The best parlays of 2 to 10 legs, ranked by value or by chance of cashing, with filters for the games (this week, next week's early lines, or both), league, book, minimum parlay odds, minimum odds and chance per leg, markets, and same-game rules. **Only this game** limits every leg to one game you pick.
Boost finder	The same search for a profit boost: enter the boost %, the minimum and maximum legs, the minimum parlay odds and the boost's maximum wager. If the boost names one game (a Thursday, Sunday or Monday night game), pick it in Only this game.
Builder	Search for any leg (tick "Show moved lines" for alternate spreads and totals), add it to the slip, or open a parlay from the finders. Enter the price the app quotes and any boost, and it shows the joint chance, the fair price, the price needed to break even, and the value at the app's price.
Record	A graded record of what the tools would have suggested: every leg worth at least break-even at DraftKings or FanDuel and 35–95% to win, and the Leg finder's best 2-leg and 3-leg parlays at each book, logged before kickoff at the price then and graded after the games, one unit each.
How it works	The method in plain words, and why "chance of cashing" is not the goal.

Reading a parlay card

Chance	The chance every leg wins. A pushed leg drops out, as the books settle it. Legs in different games multiply; legs in the same game move together, priced from correlations fitted on past games (a quarterback's yards with his receivers', a side with the total, a player's yards with his team covering, a quarterback's touchdown passes with a teammate's touchdown).
Price / Boosted	The parlay's price at the book, and after the boost.
Value	Expected return per dollar at the book's price (after the boost). Negative value is the book's edge.
Needs	The price the parlay must pay to break even. If the app quotes more, it is a good bet; less, it is not.
Fair	The price with no edge either way.
Stake	Quarter Kelly on a 100-unit bankroll ($1,000 at $10 a unit), in half units, at most 2 units and never more than the boost's maximum wager. Nothing is staked on a negative-value parlay.
Each leg	Its chance, its price at the book, and its own value. Prop legs also show the player's share of his team's targets or carries this game, his usual share when the two differ by 2 points or more, and "teammates out" when his team has players ruled out.

What the tools would have suggested, logged before kickoff at the price they had then and graded afterwards, one unit on each (`nflmodel/parlaylog.py`). **Legs**: every leg with a DraftKings or FanDuel price worth at least break-even, 35-95% to win. **Best 2-leg** and **Best 3-leg**: the Leg finder's top value parlay from different games, at each book. A pushed leg or a player who did not play drops out, as the books settle it. **Claimed** is the average value the tool showed; a record that keeps up with it is the test.

NFL

	LOGGED	GRADED	W-L-P	HIT	CHANCE SAID	UNITS	RETURN	CLAIMED
Legs (season)	128	83	51-32-0	61.5%	55.5%	+9.66	+11.6% ± 10.4%	+1.3%

BY WEEK

	LOGGED	GRADED	W-L-P	HIT	CHANCE SAID	UNITS	RETURN	CLAIMED
Week 11: Legs	254	0	0-0-0	—	—	—	—	—

The Record tab on November 11: NFL legs 51-32 for the season (61.5% against the 55.5% the tool said), best 2-leg parlays 8-24, best 3-leg 8-26; college legs 399-376 (51.5% against 49.2% said).

Where the chances come from

- **Game lines** (spreads, totals, moneylines and moved lines): the board's market-adjusted projection read off the key-number curve, shrunk to the market by the haircut. On both boards that means the market's own number: the legs carry no model edge the results have not earned.
- **NFL props**: DraftKings' and FanDuel's no-vig number, nudged toward the model by at most 7.5 points (3 before November 4). **Value is scored on the books' number alone**, so a prop shows value only when its price earns it: one book better than the other, a rung priced better than its neighbours, or a boost.

- **College props**: where DraftKings or FanDuel post the prop, the books' own chance at their real prices (no model). Lines the books do not post keep the model's chance, tagged "not market-tested", with widths fitted on college games since November 4; leave the "Include college props the books don't post" box unticked unless you know why you want them.

> **How a professional uses this page**
>
> A parlay without a boost is almost always negative value: every leg pays the book's margin. The page earns its keep with **boosts**. When a book offers one, enter it in the Boost finder, set the book, the maximum wager and the game if the boost names one, and take the top card **at the book that offered the boost**. Check every leg's price in the app first, and skip the parlay if the app quotes less than "Needs".
>
> Don't rank by chance of cashing. Heavy favourites parlayed together lose more than they win: in 2025, alternate rungs priced −400 to −1000 cleared less often than their prices said. The boosted 5-leg card above, at +37.7% value, still loses about 19 times in 20. Stake it small and expect long losing runs.
>
> Read the Record tab like the Best Bets record: is the hit rate near the chance the tool said, and is the return near what it claimed? On November 11 the NFL legs were 51-32 (61.5% against 55.5% said) and the college legs 399-376 (51.5% against 49.2% said); the best NFL 2-leg parlays were 8-24 (25% against 29% said). Two weeks of NFL legs still say little; the college legs are tracking what the tool claimed.

17. Behind the scenes: where the numbers come from, when

they change, and how the model changes

What	When (Eastern)	What it does
Update board (NFL)	Daily about 7:17 AM; full backtest Tuesdays	Rebuilds the NFL board, ledger, Best Bets record and both PDFs.
Update college board	Daily about 8:43 AM, Saturdays also 12:43 and 4:43 PM; full backtest Mondays	The same for college.
Market lines	About 10 AM, 4 PM and 10 PM daily; hourly from Sunday evening to Tuesday night	Snapshots Pinnacle, DraftKings, FanDuel, BetMGM and Kalshi; re-measures Line movement; sends the phone alerts.
Market lines backup NEW	40 minutes after each of the three daily snapshot times	GitHub often skips the daily snapshots. This scheduled check starts one plain snapshot if none ran in the last hour, and does nothing otherwise.
Game-day snapshots	Hourly at :50: college Saturdays 9:50 AM–7:50 PM, NFL Sundays 9:50 AM–4:50 PM, Thursdays 5:50 and 6:50 PM	Snapshots the league playing and rebuilds that board, so prices on the sheet are never much more than an hour old.
Derivatives	NFL Thursday, Saturday and Sunday mornings; college Fridays	Team totals and first-half lines.
Kickoff refresh NEW	35 and 20 minutes before each kickoff window	Takes a line snapshot of the league about to play and rebuilds that board, then, after the 20-minute refresh, sends the Best bets alert (section 4).
Alert rebuilds NEW	Whenever a line snapshot sends a line-movement alert	Rebuilds that league's board, any day.
NFL props	Daily, plus every 10 minutes around kickoffs	DraftKings and FanDuel props: an opening snapshot (retaken until it has the yardage lines), a pricing snapshot about three days before kickoff, and closing prices. Also rebuilds the Parlays page's legs.
College props NEW	Daily about 7:13 AM; Saturdays also about 11:13 AM, 3:13 PM and 6:13 PM	DraftKings and FanDuel college props for games in the next day or two (on Saturdays, the next five hours), for the Parlays page.
QB starter check NEW	Monday to Saturday at noon	Compares each NFL team's starter on the board with nfelo's, which its author updates by hand when news breaks. Where they differ, it writes nfelo's starter into the overrides (never over a starter entered by hand) and rebuilds the board.

College availability NEW	Every two hours Wednesday to Friday, hourly Saturday, daily otherwise	Logs every change in the college injury designations and availability reports. History only.

GitHub often starts scheduled runs late, sometimes by an hour or more, so always read the "Data as of" line. Play-by-play and results come from nflverse (NFL) and cfbfastR/CFBD and ESPN (college); injuries from the official NFL report, with hand overrides when the news is ahead of the report. Lines and prices come from The Odds API. Every week's predictions are frozen at kickoff and never rewritten.

How the model changes: the keep rule NEW

Every model change is tested before it touches the board: the rule for passing is written down before the test runs, the test is walk-forward (each season projected only from earlier ones), and it is scored on the tuning seasons, the later holdout seasons and, where there are any, real DraftKings and FanDuel lines. From November 4 to November 10 the rule was: **anything that makes the model more accurate is kept**, however small, as long as it is better on every measure the test reports and worse on none. **Since November 11 it is stricter:** better on every measure on both the tuning seasons and the holdout, the holdout by at least one standard error, and anything kept is provisional until it has been rechecked on the next full season it has not seen (small gains under one standard error are as likely noise as signal; the November 4 to 6 college additions were slightly better on the seasons tested and slightly worse on 2026). Mixed results go to Ryan as trade-offs. Changes to the player projections are also scored as the board is mid-week, before game-day inactives are known. Everything kept under the earlier rule is judged on the 2026 season alone in January. The changes kept on November 4:

Board	Change	What it moves
NFL	Spread ratings leave out interceptions and lost fumbles (turnover-free pass and rush ratings)	NFL spreads by about 0.2 points on average; no bet added or removed in Week 9
NFL	Team pass attempts use pass rate over expected; carries use the opponent's carries allowed against its opponents' usual	Player projections (Players, Props, Parlays prop legs); not the game lines
NFL	Parlays prop nudge cap 3 → 7.5 points	The chance shown on NFL prop legs; value still scored on the books' number
Both	Defense against each position in the player projections	Receiving and rushing projections, by a few percent
College	Six game-model changes: coverage defenders out, drive value, mid-season coaching change, a lower rating for an unknown backup quarterback, returning offensive production and line yards in the total	College spreads by about 0.4 points on average (up to 2.9 for teams with a coaching change); no bet added or removed in Week 10
College	Rushing and receiving calibrated per position group (backs, quarterbacks, receivers, tight ends)	Each player's projection by a yard or two
College	PFF route share and snap share in the receiving projections	Nothing yet: it turns on once PFF's 2026 data is pulled
College	College-fitted widths for the prop legs the model prices itself	Parlays page only, legs the books don't post

Tests that did not pass are written up too (FEATURES.md, PLAYERS.md and PROPS.md in the repository), so nothing is tried twice by accident.

18. The playbook: a week in the life, what to watch, what to ignore

Sunday night to Tuesday: the openers

Next week's lines open Sunday evening and Monday. The Market lines snapshots run hourly then, and every new gap pushes to your phone. **This is the most valuable window of the week.** When a push says **New, Live**, open the Line movement section, check the side's "What the model's number is made of" for stale news, and bet it at the best price. By Tuesday night most of the movement has happened.

Midweek

Watch for **Live → Partly gone** pushes on bets you hold. That is closing line value arriving. Check the injury report (it changes the model's number, shown in red) and the Bet sheet after each morning's update. NFL quarterback changes now reach the board automatically by noon, Monday to Saturday, through the starter check. A bet that leaves the sheet is marked withdrawn. That is the board changing its mind, and you should know why before you do anything about it.

Friday and Saturday (college), Saturday and Sunday (NFL)

- Download the **Best bets** PDF the morning of the games. That is the card. Twenty minutes before each kickoff window, the **Best bets alert** gives you the final card at DraftKings and FanDuel: bet what it lists, skip what it marks NOT A BET.
- If a book offers a **profit boost**, run it through the Parlays page's Boost finder and take the top card at that book, after checking each price in the app.
- Take **price bets** only at the price shown or better. With hourly game-day snapshots the board's prices are about an hour old; if a row is greyed with "Check the price", it is older than three hours.
- Bet **wind unders** as soon as the wind is in the forecast, at the half stake shown.
- For **Missed** sides, look at the teaser table for legs that clear 73.9%, Wong legs first.
- Check the weekly cap line. If it bit, your stakes are already scaled.

What to ignore

- The NFL model's own edges and every game's lean (Model leans). Information, not bets.
- College model edges. They are on the sheet so they are recorded, but they carry no stake.
- Big EV numbers on model edges without reading the stake column.
- Rain and snow tags. Information until the forecasts have been graded.
- Unboosted parlays, and parlays ranked by chance of cashing.
- A week's win-loss record. Watch CLV.

- Prop flags (there are none) and prop "leans".

19. Reviewing your bets: what a loss can and cannot teach you

A loss on a bet that beat the closing line was a good bet that lost. A win on a bet that the line moved against was a bad bet that won. Review in this order:

1. **Did I get the price?** Compare your price to the board's and to the close. CLV is the grade, and the Closing line value section shows it by kind of bet.
2. **Was it on the card at kickoff?** The Best Bets record and the Live record's kept/withdrawn split tell you whether to trust the first word or the last.
3. **Was the reason right?** On the game page, did the model's number rest on news that turned out wrong (a quarterback who didn't start)?
4. **Only then, the result.** Spread bets near 50% will lose five in a row about one week in thirty-two by chance alone.

20. Dictionary

Anchor. The book a game's projection is tied to: Pinnacle when it quotes the game, else the consensus.

Best bets alert. The final card for a kickoff window at DraftKings and FanDuel only, pushed to your phone and emailed 20 minutes before kickoff (section 4).

Best Bets record. The record of only the bets on the Best bets card as it stood at each kickoff (section 14).

Boost finder. The Parlays page tool that finds the best parlays for a profit boost (section 16).

Break-even. The win rate a price needs to be worth nothing: 52.4% at −110.

Bucket. A kind of bet with its own record: price, opener, wind, model.

Bucket stake. A stake sized from the bucket's record instead of the model's, at the book with the best price against Pinnacle; "(bucket)" on the sheet.

Check the price. The verdict on a price bet whose quote is more than three hours old.

CLV (closing line value). The EV of the price you took at the closing no-vig chance. Positive means you beat the close.

CLV guard. The rule that takes the stake off a kind of bet with 50+ graded bets whose closing line value is below zero by more than two standard errors; its bets stay listed, marked muted.

Close win rate. How the opener bucket's sides did graded at the closing line: 51.9% for NFL spreads 2+, below break-even.

Defense against each position. A defense's record against wide receivers, tight ends and backs, against what those players were projected for, applied to the player projections as a small factor.

EV. Expected value per dollar staked.

Haircut. The share of the model's claimed edge that has shown up as profit in the last eight seasons; stakes are sized from it. NFL 11% ± 29% on November 11 (model edges kept off the card); college measured 52% but capped at 0 since November 1.

Keep rule. Since November 11, 2026: a model change is kept if it is better on every measure its test reports, on the tuning seasons and the holdout, the holdout by at least one standard error; it is then provisional until rechecked on a season it has not seen. (November 4 to 10: any gain, however small.)

Record-adjusted EV. The EV at the chance the stakes are sized from: the model's edge counted only at the share that has shown up in graded bets. It leads wherever a model EV is shown, with the model's own claim under it.

Kept / withdrawn. Whether a ledger bet was still on the sheet at kickoff, or came off before.

Kickoff refresh. The line snapshot and board rebuild 35 and 20 minutes before each kickoff window.

Kelly. The stake that maximizes long-run growth for a given edge; the board uses a quarter of it.

Line movement statuses. Live (the gap still clears the threshold, or the line has moved no more than half a point), Partly gone (the line has come part of the way), Missed (the line has reached the model).

Leg finder. The Parlays page tool that ranks parlays of 2 to 10 legs by value or by chance of cashing (section 16).

Market-adjusted projection. The market's line moved part of the way toward the model (28% on NFL spreads, 5% on totals, 17% for early lines). Every bet is priced from it.

Missed. An opener bet the market has already moved to, or a wind under whose total has already dropped 1.5 points.

Model leans. The document of the model's opinions that are not bets (section 7).

Needs. On a parlay card, the price it must pay to break even.

No-vig. A price with the book's margin removed: the market's estimate of the true chance.

ntfy. The phone app that receives the line-movement pushes; the topic name is the repository secret NTFY_TOPIC.

Opener. The first line posted for a game. The board uses the data's opener (nfelo for the NFL, cfbfastR for college), the number the bucket was backtested on, then Pinnacle's first stored quote, then the first line the board saw.

Nudge. How far an NFL prop leg's chance is moved from the books' no-vig number toward the model on the Parlays page: at most 7.5 points. Value is still scored on the books' number.

Pinnacle. The sharp book every price is judged against.

Post at. The highest Kalshi contract price at which a resting (maker) order is still +EV against the chance the stakes are sized from.

Price tier. A retail price that beats Pinnacle's no-vig number by 1% or more, with no model.

Rain / snow tag. A game forecast to get 2 mm or more of rain, or any snow; shown, not bet.

Raw model. The model's projection before it is weighed against the market.

Teaser. A parlay with every line moved in your favor; two legs of 6 at −120 need each leg above 73.9%.

Vig. The book's margin.

Week 18 at the market. The model's Week 18 spreads and moneylines are not bet (opener and model tiers, alerts); price bets and totals still count.

Weekly cap. 10% of bankroll on one week's bets together; above it every stake that week shrinks by the same factor.

Wind under. An outdoor NFL under in 10–19 mph of forecast wind, staked at half size until graded on forecasts.

Wong teaser. A 6-point teaser leg that crosses both 3 and 7: a favorite of −7.5 to −8.5 or an underdog of +1.5 to +2.5. Price them, do not bet them by rule.

Fifth edition, updated November 11, 2026 from the live boards (fourth edition November 4, third October 31). The screenshots are re-shot with `scripts/manual_shots.py`. Numbers change every day; the explanations do not. For research and entertainment; nothing here is betting advice.
